Request To Submit Concurrent Development Applications

Acknowledgment and Agreement

The City of Scottsdale recognizes that a property owner may desire to submit concurrent development applications for separate purposes where one or more of the development applications are related to another development application. City Staff may agree to process concurrently where one or more the development applications related to the approval of another development application upon receipt of a complete form signed by the property owner.

ESLO Wash Modifications

Justification for Modification

The Zoning Administrator may authorize a Wash Modification if ALL of the following criteria are met. Use the space provided to present your evidence that the requested exemption satisfies the modification requirements; please attach all supporting documentation.

_	Proposed modifications will result in an equal or enhanced quality of open space: YES - WATERCOURSE
_	ENTRANCE AND EXIT POINTS WILL REMAIN. THE WASH WILL BE
-	MORE DEFINED ADVACENT TO THE PROPOSED IMPROVEMENTS.
_	Modifications will include restoration of the watercourse with vegetation of the same type and density removed:
	A COMPREHENSIVE LANDSCAPE PLAN IS BEINE PREPARED BY
_	NORRIS DESIGN. LARGE N.A.O.S. AREAS ARE ALSO BEING PROVIDED TARAUGHOUT THE SITE.
	Is the wash being redirected or modified? No XYes If yes, the wash must enter and exit the site at the historic locations, and the result of the modifications shall not impact
_	drainage considerations for adjacent properties: SLIGHTLY MODIFIED ADVACENT TO THE PROPISED IMPROVEMEN
_	drainage considerations for adjacent properties: SLIGHTLY MODIFIED ADVACENT TO THE PROPISED IMPROVEMENT GABION RETAINING WALL, CULVETY PIPES AND HEADWALLS
	drainage considerations for adjacent properties: SLIGHTLY MODIFIED ADVACENT TO THE PROPISED IMPROVEMENT GABION RETAINING WALL, CULVETY PIPES AND HEADWALLS
	drainage considerations for adjacent properties: SLIGHTLY MODIFIED ADVACENT TO THE PROPISED IMPROVEMENT GABION RETAINING WALL, CULVETY PIPES AND HEADWALLS WILL BE UTILIZED TO CONVEY RUNIFF BEZOW ALLESS POINT
	drainage considerations for adjacent properties: SLIGHTLY MODIFIED ADVACENT TO THE PROPISED IMPROVEMENT GABION RETAINING WALL, CULVETY PIPES AND HEADWALLS WILL BE UTILIZED TO CONVEY TUNNIFF BELOW ACCESS POINT TO AND FROM THE FIRE STATION. Is the wash being diverted into a structural solution (e.g. underground pipe)? No Yes If yes, the change must not impact the drainage conditions on adjacent properties and shall not reduce the integrity of any

21. Project Narrative

Fire Station 616 will be placed in a highly developed suburban ranch community. The proposed station would be a permanent station to replace the existing metal shed building in the area. It will provide faster response time by placing it along Cave Creek Road. Its permanence will ensure improved operations for fire fighters and offer protection to costly equipment as well as to their emergency vehicles, currently exposed to the environment.

Drastic topography encompasses the site area with a high ridge towards the north east of it and low valleys surrounding it, that serve as natural washes (1). As the site presents itself as the major challenge, much of the natural features will be preserved. Although parts will require infill to level off for a building pad, the larger amount of the parcel will remain intact.

Initial studies identified setbacks, easements, utilities, washes, and vegetation on the site (2). Planning was then processed and that placed the building near the center where there is the most open space and less vegetation to impact. The placement does not encroach on the neighborhoods' view of the Gold Mountains or Pinnacle Peak.

The proposed design respects natural site attributes and is influenced by surrounding natural features. The building has been placed at the base of the peak where it then mimics the slope with a large sloped roof form of a rust color to blend into natural color tones of the site. The large overhangs shade the building to prevent heat gain during the summer months (3). No equipment will be placed over it to prevent undesired views and the highest roof point will not exceed 23'. The existing natural washes surrounding the building pad will be preserved through culverts under the roads leading up to the building (4).

The main ingress point off of Cave Creek road on the north east bound lane, now integrates a deceleration lane to minimize the disruption of traffic as fire trucks return to the station (5). Egress for employees and patrons occurs through the same access point. When arriving to the station, one first turns into the station from Cave Creek Road to the access road that has a subtle dip area to conform to the existing topography (6). Natural vegetation surrounds the road as one then continues to drive over culverts of natural washes. Visitors will now arrive at the first bank of parking area, while fire fighters and accessible need patrons proceed along the road to the next bank of parking areas available. Smaller parking areas were created to conform to topography and combat the 'large parking lot' principle (7). Pedestrians and cyclists are walked into the site through a decomposed granite path from the main road up to the front of the building, where parking racks are provided for bicycles (8). While driving on Cave Creek road, everyday commuters will only have glimpses of the building as most of it will be sheltered with native vegetation (9) and the use of primary materials such as integral colored CMU and weather metals that aid in the process of blending into the site.

Passive solar methods have been instated to reduce energy cost and reduce carbon footprint. The large roof contributes in shading the building. Window covers have been added to prevent direct sunlight from entering the building, while still allowing natural diffused light to enter the building (10). Landscape will be added in exposed areas that would contribute to large heat gain. Water collection areas have been created to capture rain runoff and properly distribute the excess water to plants around the site (11). Materials selected for the project were chosen

with longevity in mind and a minimal maintenance approach for the high use of this facility for years to come.

No mechanical equipment will be placed on the main roof (Sloped roof). Equipment will be placed on northeast flat roof area. Parapets and screens will be integrated to prevent undesired views. All other mechanical equipment required for the project will be within the mechanical yard or placed behind screens and vegetation. Exterior lighting is of minimal impact to adjacent properties. All lighting fixtures have been chosen to only provide down light at low light levels. The lighting will only guide visitors through the entrance road and will be used along paths to allow for pedestrians to see where they are stepping. Building lighting will be used to light unsafe areas and not used to call attention to itself. Roadside signage will make use of natural earth tones to only signal what is there and not detract from natural views.

Current building positioning restrictions:

- Site setbacks, easements and existing drainage patterns have dictated the location of the building pad.
- Topography within the site is drastic. A high peak point to the northeast renders that area essentially unusable. Low washes to the west place the building in flood zone.
- In an effort to not disturb much of the site, road topography was adjusted to site contours while still providing proper turn radius and access for emergency service vehicles.
- Emergency service vehicles egress onto Cave Creek Road requires maximum visibility; placing the building elevation higher than the existing roadway.
- Retention basins need to be integrated into the design. Current placement of the building allows for proper drainage.

NOTE: This item correlates with item 50. Sensitive Design, of the Development Review Application Checklist.
