1.0 INTRODUCTION

1.1 SCOPE

Coe & Van Loo Consultants, Inc. (CVL) has been contracted by Diamond Creek Family Partnership to provide engineering services in support of the proposed Diamond Mountain Estates project (the site). The purpose of this report is to provide preliminary hydrologic and hydraulic analysis for the proposed development. In addition, this report addresses off-site drainage, on-site drainage and stormwater retention requirements.

This report is focused on providing preliminary design information, evaluation, and analysis for statistical flood events up to and including the 100-year storm. The scope of this assessment does not include evaluation of stormwater runoff resulting from storm events exceeding the 100-year frequency event. Hence, it should be noted that a storm event exceeding the 100-year frequency may cause or create the risk of greater flood impact than is addressed and presented in this assessment.

The procedures used herein are derived from, and performed with, currently accepted engineering methodologies and practices. Additionally the criteria for this evaluation are designed to conform to currently applicable ordinances, regulations, and policies as set forth by the City of Scottsdale and Maricopa County.

1.2 REGULATORY JURISDICTION

The development is designed to meet drainage requirements as stated in the Design Standards and Policies for City of Scottsdale [1], the Flood Control District of Maricopa County Drainage Design Manuals for Maricopa County, Arizona, Volume I, Hydrology [2], and Volume II, Hydraulics [3].

2.0 LOCATION & SITE DESCRIPTION

The Diamond Mountain Estates project is located within the City of Scottsdale, Maricopa County, Arizona. The site is bordered on the south by E Jomax Rd, on the east by N 112th St (alignment), on the west by native desert land, and on the north by residential property followed by E Bajada Rd. The site is located within the southeast quarter of Section 33, Township 5 North,

Range 5 East of the Gila and Salt River Base and Meridian, Arizona. See Figure 1 for a Locations and Vicinity Map.

3.0 Proposed Development

The proposed single family residential development will consist of 2 lots that will meet standards of the City of Scottsdale without the need to amend any of the underlying development standards.

4.0 Flood Zone Information

The Maricopa County, Arizona and Incorporated Flood Areas Flood Insurance Rate Map (FIRM), panel number 04013C1330L [4], indicates the site falls within Zone "X".

Zone "X" is defined by FEMA as:

> "Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood."

Refer to Figure 2 for a copy of the Flood Insurance Rate Map (FIRM).

5.0 Offsite Hydrology

5.1 Background

The site is currently composed of natural desert land. There is one major wash and multiple small washes that cross the site from the north and east. The major wash will cross through the site mostly without obstruction along the property line. Refer to Plate 1 for offsite areas delineation. Local off-site hydrology is based on the Rational Method in accordance with the Drainage Design Manual for Maricopa County, Arizona, Volume I, Hydrology [2].

5.2 Existing Offsite Flow Management

Offsite flows impacting the site have been previously studied in the Final Drainage Report (FDR) for Diamond Mountain Estates by Coe & Van Loo Consultants, Inc. [5], revised March 2015.

The technical analysis described and referenced in this report are consistent with the assumptions and analysis contained in the FDR (Refer to Appendix A). According to the FDR, the 100-yr off-site runoff of 333.8 cfs impacting the site from the east is conveyed throughout the site by means of existing natural drainage paths. The runoff continues through and exits the site on its southern boundary.

5.3 Proposed Offsite Flow Management

To safely convey the off-site flows through the site, two washes entering the eastern property boundary are routed under the proposed entry road (Chase Way) and back to the historical flowpath.

Water surface calculations were conducted where the washes cross the east property boundary and subsequently Chase Way. Culverts were designed such that the water ponding immediately upstream of the culverts will not pond water on the property owners to the east. A 20-foot offset from the east property boundary to the entry road right-of-way is proposed (see Plate 4). See Appendix D for culvert analyses and water surface elevations.

Water surface calculations were also conducted at three locations along the wash in order to estimate flow limits. A proposed drainage easement encompasses the flow limits. Refer to Appendix D for water surface elevations and Plate 3 for the proposed drainage easement location and cross section locations.

6.0 Management of On-Site Runoff

6.1 On-Site Hydrology

Management of on-site flows will be the responsibility of future homeowners in support of grading and drainage plans. On-site hydrology will need to be based on the Rational Method in accordance with the Drainage Design Manual for Maricopa County, Arizona, Volume I, Hydrology [2]. Weighted runoff coefficients (C-value) for the proposed development will be taken from the City of Scottsdale Design Standards and Policies Manual [1] and rainfall data will be taken from NOAA Atlas 14.

6.2 On-Site Runoff Management Plan

The roadway (Chase Way) is sumped at two culvert locations to allow onsite roadway flows to enter washes (Refer to Plate 4). On-site drainage management for individual lots will be the responsibility of the homeowner.

6.3 Retention Requirements (Stormwater Detention)

The development is in the hillside landform and the 2-year, 10-year, and 100-year storm events were analyzed to determine if the post-developed condition runoff exceeds the pre-development condition at each location where runoff exits the site (Refer to Appendices A and B, and Plates 1, 2, and 3). The Drainage Exhibit showing onsite volume generated from Chase Way, to be waived, and supporting documents are provided in Appendix C and E.

7.0 Summary and Conclusions

1. The Maricopa County, Arizona and Incorporated Areas Flood Insurance Rate Map (FIRM) panel number 04013C1330L indicates the site falls within Zone "X".
2. One natural wash has been identified. Disturbance will not occur.
3. The 100-year offsite flow affecting the site at the east boundary is 333.8 cfs.
4. Pre-project vs. Post-project peak flows satisfy requirements.
5. Both custom lots will need to submit grading and drainage plans for approval.
6. The design of hydraulic structures and hydrologic analysis are based on generally accepted engineering practices and in accordance with local requirements.

Final Drainage Report
For
Diamond Mountain Estates

TABLE OF CONTENTS

1.0 INTRODUCTION

1.1. Scope

Coe & Van Loo Consultants, Inc. (CVL) has been contracted by Diamond Creek Family Partnership C/O Robert J. Campo (developer) to provide engineering services in support of the development of Diamond Mountain Estates (the site). The purpose of this report is to present preliminary hydrologic and hydraulic analysis of the proposed development. In addition, this report addresses off-site drainage and retention requirements.

This report is focused on providing practical design information, evaluation, and calculations for statistical flood events up to and including the 100-year frequency flood. A storm event exceeding the 100-year event may cause or create the risk of a greater flood impact than is addressed and presented in this assessment. The procedures used herein are derived from, and performed with, currently accepted engineering methodologies and practices. Additionally, the criteria for this evaluation conform to currently applicable ordinances, regulations and policies promulgated by the City of Scottsdale and Maricopa County for the referenced site.

1.2. Regulatory Jurisdiction

The development is designed to meet the City of Scottsdale and the Maricopa County requirements in accordance with the *Design Standards and Policies Manual for City of Scottsdale*, the *Drainage Policies and Standards Manual for Maricopa County, The Drainage Design Manual for Maricopa County, Arizona, Volume I, Hydrology* and the *Draft Drainage Design Manual for Maricopa County, Arizona, Volume II, Hydraulics* (Ref. 1, 2, 3 and 4).

2.0 LOCATION

The proposed Diamond Mountain Estates development (the site) is located in the jurisdiction of the City of Scottsdale, Arizona and within the southeast quadrant of Section 33, Township 5 North, and Range 5 East. The site is bordered by Jomax Road to the south and by 112th Street (Alignment) to the east.

3.0 SITE DESCRIPTION AND PROPOSED DEVELOPMENT

The site is designed to accommodate 30 custom homes lots. This report addresses detention requirements for the proposed drives. Each lot would have to submit a grading and drainage plan for approval by the appropriate municipalities and agencies. The site is split in two sections by an existing mound, the east section sloping east and the west section sloping west. Slopes range generally between 2% and 25%. The site is currently rocky with native vegetation, one existing house and few washes going through from the north and east.

4.0 FEMA FLOODPLAIN CLASSIFICATION

The Maricopa County, Arizona and Incorporated Areas Flood Insurance Rate Map (FIRM) panel numbers 04013C1330L, revised October 16, 2013, indicates that the proposed development falls within a Zone "X".

A Zone "X" is defined by FEMA as: "Areas of 0.2% annual chance flood; area of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 foot square mile". Refer to Figure 2 for a copy of the Flood Insurance Rate Map (FIRM).

5.0 OFF-SITE DRAINAGE DESCRIPTION

5.1. Existing Off-Site Flow Management

There are two major washes and multiple small washes that cross the site from the north and from the east. The major washes will cross through the site mostly without obstruction along the property line. Refer to Plate 1 for offsite areas delineation. The local off-site hydrology is based on the Rational Method in accordance with the *Drainage Design Manual for Maricopa County, Arizona, Volume I, Hydrology* (Reference 3). Existing condition off-site runoff calculations are presented in Appendix A. An existing 10'x3' box culvert is located under Jomax Road where the flow from both major washes runs through.

5.2 Proposed Off-Site Flow Management

To safely convey the regional off-site runoff through the proposed development, the existing major natural washes will be used. As previously mentioned, washes will cross through the property limits and into our site in their natural condition and generally without obstruction nor rerouting and will merge with onsite flows. See section 6 and section 7 of this report for a more detailed discussion for onsite flows.

6.0 ON-SITE DRAINAGE DESIGN DESCRIPTION

6.1. On-Site Hydrology

The on-site hydrology will be based on the Rational Method in accordance with Reference 1 and 3. Drainage sub-basins will be delineated in accordance with the preliminary grading plans. The rainfall intensities will be based on NOAA Atlas 14 and time of concentrations for the 10-, 50-, and 100-year intensities will be based on Reference 3. The 10- and 100-year weighted runoff coefficients (C-value) for the proposed development are from Figure 4.1-4, page 20 Design Standards and Policies Manual, City of Scottsdale January 2010. Refer to Appendix A for the weighted runoff calculations.

6.2. On-Site Runoff Management Plan

The on-site drainage facilities will be designed in accordance with the City of Scottsdale and the Maricopa County drainage regulations (Ref. 1, 2, 3 & 4). The streets within the site will be designed to convey on-site stormwater towards the retention basin.

The local streets within the proposed development will be designed such that the 10-year flow is contained within the street curbs. The 100-year flow is contained within the right-of-way and 12-inches below the finished floor of adjacent buildings with a maximum depth of 8 inches; a maximum flow of 100 cfs; and a maximum velocity of 10 fps (Ref. 2 & 4). The surface runoff from the site will be collected into storm drain systems and then into the detention basins.

Floodplain delineation will be provided at final drainage report and will not be disturbed except where they cross under the roads through culverts. See Appendix B for proposed preliminary culvert sizes.

The detention basins R1, R2 and R3 will be constructed to accept storm water from most of the site and all disturbed area, and will detain as needed to control the proposed peak discharge to less than the pre-developed peak discharge through weirs and pipes. R3 on the east side of the site will detain the adjacent proposed road and will discharge through a pipe into the adjacent wash. R1, located in the middle of the site, will be graded as one or multiple basins to detain storm water then discharges through a weir and storm pipe into R2. The discharge from R2 will be controlled by a weir so that the peak flow from R2, added to all flow from other non-detained areas, will meet the requirements for water quality and water quantity.

Table 1.1 Summary of Results

	PRE-DEV AREAS	PRE-DEV Q100 (CFS)	POST-DEV AREAS	POST-DEV Q100 (CFS)
FLOW WEST	B,C, 1, 1A, 2, 3	256.79	B,C, 1, 1A, 2, 2A	188.88
FLOW SOUTH	A, 4, 4A	333.84	A, 3	333.84
FLOW NORTH	5	18.73	4	18.73

7.0 STORMWATER DETENTION REQUIREMENTS

The detention concept is to provide detention basins to detain as required to control the ultimate peak flow from the site to less than the current, pre-developed, peak flow. The calculations provided in accordance with Maricopa County standards (Reference 2). The equation that governs the volume required is:

Vr = A x C x (P/12) = retention volume required in acre-ft.
C = rational runoff coefficient = Refer to Appendix A.
P = rainfall depth = 2.7 for the 100-year, 2-hour storm event
A = area in acres

The retention basin will be designed to drain within 36 hours by means of infiltration (Ref. 2 & 4). Refer to Appendix B for the hydro flow modeling for post-developed flows.

The development is in the hillside landform and the 10-year and 100-year storm events are analyzed so that the discharge rates at post-developed conditions do not exceed pre-developed conditions at all locations where runoff exists the site. Refer to Plates 1, 2, 3. The stormwater Storage Waiver Form is provided in Appendix C.

8.0 CONCLUSIONS AND RECOMMENDATIONS

1. The 100-year off-site flows are safely conveyed through the site.
2. Two natural washes have been identified. Disturbance will only occur at the culvert crossings.
3. The 10-year on-site runoff will be conveyed within the street section below the top of curb. The 100-year runoff will be conveyed within the street right-of-way with a maximum depth of 8 inches and 12-inches below the finished floor of adjacent buildings.
4. Pre-Developed Vs. Post-Developed detention for the 100-year, 2-hour storm event will be provided for the on-site and adjacent arterial street.
5. Retention basins will be designed to drain within 36 hours by means of infiltration. For the retention basins adjacent to the existing natural washes, bleed off pipes will be installed to allow storm water to drain at a metered rate.
6. All finish floor elevations will be designed to be a minimum of 14 inches above the low outfall of the subdivision and adjacent retention basin and at least 12 inches above the expected 100-year water surface elevation in adjacent streets and drainage paths.
7. All custom lots will have to submit a grading and drainage plans for approval.
8. The design of hydraulic structures and hydrologic analysis will be based on generally accepted engineering practices and in accordance with local requirements.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

APPENDIX D

Hydraulic Analyses

Culvert Analysis Report
DME - Culvert #1 South

Comments
25 31 acres - Offsite Sub-basin A 1 (south portion of Basin A)

Total Basin A Area = 88 ac
Percentage of portion of Basin A to south= 29%
Prorated Q = 29% of 333.84 cfs = 96 02 cfs

Analysis Component			
Storm Event	Design	Discharge	96.02 cfs

Peak Discharge Method. User-Specified			
Design Discharge	96 02 cfs	Check Discharge	0 00 cfs

Tailwater Conditions Constant Tailwater	
Tailwater Elevation	N/A ft

Name	Description	Discharge	HW Elev.	Velocity
Culvert-1	4-36 inch Circular	96 02 cfs	2,640 03 ft	14 12 ft/s
Weir	Not Considered	N/A	N/A	N/A

Culvert Analysis Report
DME - Culvert #1 South

Component: Culvert-1

Culvert Summary					
Computed Headwater Elevation	2,640 03	ft	Discharge	96 02	cfs
Inlet Control HW Elev	2,639 84	ft	Tailwater Elevation	N/A	ft

Discharge	333.84	ft³/s

Cross Section Image

Worksheet for Cross Section #2

Project Description

Friction Method	Manning Formula
Solve For	Normal Depth

Input Data

Channel Slope	0.01176	ft/ft
Discharge	333.84	ft^3/s

Section Definitions

Station (ft)	Elevation (ft)
0+00	2631.00
0+05	2630.00
0+06	2629.00
0+08	2628.00
0+14	2627.00
0+19	2628.00
0+21	2629.00
0+23	2630.00
0+28	2631.00

Roughness Segment Definitions

Start Station	Ending Station	Roughness Coefficient
(0+00, 2631.00)	(0+05, 2630.00)	0.045
(0+05, 2630.00)	(0+23, 2630.00)	0.032
(0+23, 2630.00)	(0+28, 2631.00)	0.045

Options

Current Roughness Weighted Method	Pavlovskii's Method
Open Channel Weighting Method	Pavlovskii's Method
Closed Channel Weighting Method	Pavlovskii's Method

Results

Normal Depth	3.60	ft
Elevation Range	2627.00 to 2631.00 ft	

Worksheet for Cross Section #2

Results

Flow Area		48.22	ft²
Wetted Perimeter		25.54	ft
