LIST OF FIGURES

EXECUTIVE SUMMARY

The Winery Suites development is located on the southwest corner of Goldwater Boulevard and 1st Street in Scottsdale, Arizona. The proposed site currently consists of the LDV Wine Gallery and Tasting Room and Studio B Interior Design. These tenants have since moved to new locations and the current parcels are now occupied by three dwelling units with flexible leasing terms. The redevelopment will consist of approximately 1,500 square-feet of ground-floor retail space and 31 dwelling units with flexible leasing terms in a mid-rise building. The vicinity of the site is provided in **Figure 1**.

CivTech, Inc. was retained by Horizon Pediatric Therapy, Inc. to perform a traffic impact and mitigation analysis (TIMA) for the proposed redevelopment. The purpose of this assessment is to address the traffic and transportation impacts of the proposed development on the surrounding streets and intersections. The following conclusions have been documented in this study:

- The results of the existing conditions analysis indicates that all study intersections operate with acceptable levels of service (LOS D or better), with the exception of the intersections of 69th Street & Indian School Rd, Goldwater Boulevard & Indian School Road and Goldwater Blvd & Main Street.
    - Currently, the unsignalized intersection of **69th Street and Indian School Road** operates poorly during both the AM and PM peak hours on the northbound and southbound approaches. This delay is due to the high wait times of vehicles making northbound left turns and southbound left turns because of the high volume of through traffic on Indian School Road during both peak hours. Extensive delay during either peak hour at minor roads or driveways that intersect major roads is expected.
    - The signalized intersection of **Goldwater Boulevard and Indian School Road** currently operates adequately in the AM peak hour, but has an overall intersection delay of 54 seconds in the PM peak hour. The threshold for an adequate level of service is 55 seconds, so it is very near to operating at a poor level of service.
    - The signalized intersection of **Goldwater Boulevard and Main Street** experiences delay on the eastbound and westbound approaches of the intersection during both the AM and PM peak hours. This delay is present because the signal operates under actuated-coordinated phasing, meaning that the eastbound and westbound green phases are only triggered when a vehicle approaches. Since Main Street is a minor road, very few vehicles approach the intersection from the east or west, so when they do, there is substantial delay. As more traffic uses this road in the future, the eastbound and westbound delay is likely to decrease.
- The number of crashes reported at the intersection of Goldwater Boulevard and 1st Street does not rise to the level of warranting consideration of a traffic signal based solely on crash experience. CivTech estimates that the existing development could potentially generate 142 external weekday daily trips, 3 trips during the AM peak hour, and 14 trips during the PM peak hour.

- The proposed redevelopment is anticipated to generate 734 external weekday daily trips, 62 trips during the AM peak hour, and 61 trips during the PM peak hour.
    - As compared to the existing uses, the proposed redevelopment could generate an additional 592 external daily trips with 59 additional trips in the AM peak hour and an additional 47 trips in the PM peak hour.

- The results of the 2020 peak hour analysis shows that all intersections operate at a level of service LOS D or better with the exception of the following intersections.

    - The unsignalized intersection of **69th Street and Indian School Road** is expected to continue to operate poorly during both the AM and PM peak hour on the northbound and southbound approaches. Intersections with minor approaches perpendicular to major approaches are expected to operate with delay during certain times of the day when the major road is busy, usually during the peak hour. Due to the location of this intersection to surrounding major intersections and the offset of the driveway from 69th Street, a signal will not be installed at this intersection. If there is significant delay during either peak hour, vehicles will use another route. Mitigation for this intersection is not recommended at this time.

    - The signalized intersection of **Goldwater Boulevard and Indian School Road** is expected to continue to operate poorly during the PM peak hour during both the no-build and build scenarios. The overall intersection delay during both scenarios is expected to be approximately 56 seconds. The threshold for an acceptable level of service is 55 seconds. Since the overall delay is very close to an acceptable level of service, no mitigation measures are recommended at this time, however, they could become necessary in the future.

    - The signalized intersection of **Goldwater Boulevard and Main Street** is expected to experience delay on the eastbound and westbound approaches of the intersection during both the AM and PM peak hours. This delay is present because the signal operates under actuated-coordinated phasing, meaning that the eastbound and westbound green phases are only triggered when a vehicle approaches. Since Main Street is a very small road, very few vehicles approach the intersection from the east or west, so when they do, there is significant delay. If more traffic uses this road in the future, the eastbound and westbound delay is likely to decrease.

- The existing storage lengths at the existing intersections are anticipated to accommodate the additional traffic generated by the proposed development with the exception of the northbound left turn lane at the intersection of Goldwater Boulevard and Indian School Road. No additional northbound left-turns are expected to be added from site generated traffic, meaning that the number of northbound left-turns is the same for the AM and PM peak hours for the no-build and build scenarios. Additional storage length calculations should be completed

prior to traffic signal installation, a change in intersection stop control or installation of raised medians.

- The contractor should ensure that adequate sight distance is provided at all site access points to allow safe left and right turning movements from the development. It is recommended that sight triangles be designed at all site access driveways to provide the required sight distance shown in *Appendix 5-3B* within the *City of Scottsdale Design Standards and Policies Manual*.

INTRODUCTION

The Winery Suites development is located on the southwest corner of Goldwater Boulevard and 1st Street in Scottsdale, Arizona. The development is proposed for two parcels of land, formerly zoned for residential use, totaling 0.62 gross acres. The two parcels are proposed for a mixed-use development with 34 dwelling units with flexible lease terms and approximately 1,500 square feet (SF) of retail space on the ground floor. Parking will be provided underground, with the entrance located in the alley bordering the site to the south, and there will be on-street parking provided in the alley as well. The vicinity of the site is provided in **Figure 1**.

Study Requirements

This study analyzes the traffic impact due to the proposed development on the surrounding street network. The study will be prepared in conformance with the City of Scottsdale *Design Standards and Policies Manual*, Chapter 5, Transportation Impact Studies, 2018. The specific objectives of the study are:

- To determine the existing site generated trips through trip generation rate calculations
- To determine whether the planned street system in the vicinity of the site is adequate to accommodate the increased traffic that results from the proposed development.
- To recommend additional street improvements or traffic control devices, where necessary, to mitigate the additional site-generated traffic; and,
- Evaluate the internal site circulation and provide recommendations if necessary.

Study Area

The study area has been defined as including the following intersections:

- Goldwater Blvd & Alley
- Goldwater Blvd & 2nd St
- Goldwater Blvd & Indian School Rd
- Goldwater Blvd & Main St
- Goldwater Blvd & 1st St
- 69th St & Indian School Rd
- 69th St & Alley
- 69th St & 1st St
- 69th St & 2nd St

Horizon Years

This study has been conducted to conform to the *Design Standards and Policies Manual (DS&PM), Chapter 5*, Transportation Impact Studies, prepared by the City of Scottsdale in 2018. Since the owner is applying for a change in zoning, per the *DS&PM*, a Category 2 TIMA is required. For a Category 2 TIMA, the existing year and the opening year will be analyzed. The existing year is 2018 and the opening horizon year for this development will be 2020.

The study intersections and the site accesses will be analyzed for AM and PM peak hours to determine the recommended intersection lane configuration, intersection stop control, turn lane storage requirements, and roadway typical sections for the development.

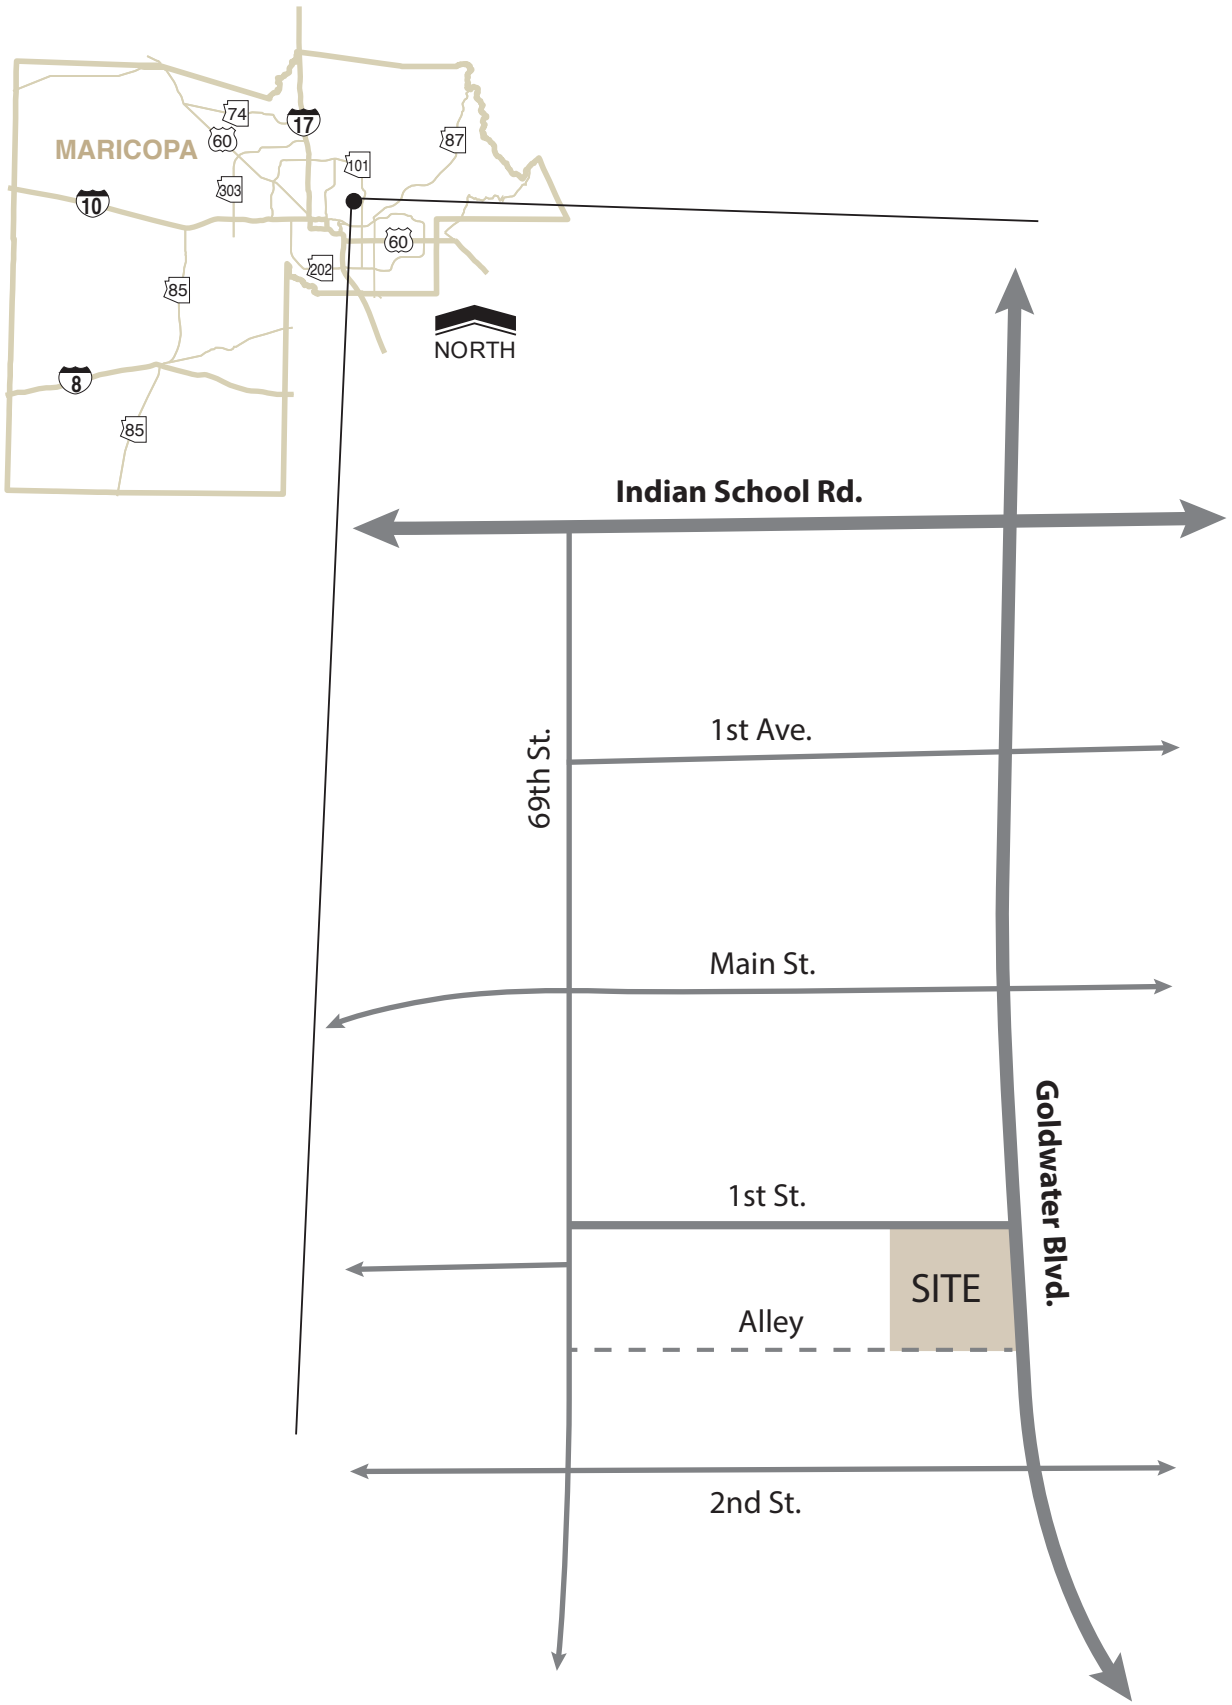

Figure 1: Vicinity Map

EXISTING CONDITIONS

LAND USE

The site of the proposed Winery Suites, according to the Maricopa County Assessor, was previously occupied by the LDV wine tasting room and Studio B Interior Design. Both of these businesses have since moved and the parcels are now occupied by a three dwelling units with flexible leasing terms.

SURROUNDING LAND USE

Surrounding the site on all sides are multi-family residential units and some small businesses. Northwest of the site is the Hotel Valley Ho. Directly east of the site is the La Loma bus station, a major hub for the Valley Metro Bus system. The site can be accessed by bus route 72. Indian School Road, north of the site, allows direct access to Pima Freeway (Loop 101).

ROADWAY NETWORK

The existing roadway network within the study area includes the following:

Goldwater Boulevard is a north-south five-lane road within the vicinity of the site classified as a major arterial by the City of Scottsdale. There are three (3) lanes in the southbound direction, two (2) lanes in the northbound and raised medians along portions of the road. This road begins just south of Chaparral, breaking off from Scottsdale Road to the west, and rejoins Scottsdale Road at the intersection with Osborn Road. This road allows traffic to bypass Old Town Scottsdale and provides access to major and minor arterials to the west of the site. The posted speed limit is 35 mph.

69th Street is a north-south two-lane road bordering the proposed site to the west. There is one (1) lane in each travelling direction. 69th Street begins at the intersection with Indian School Road and continues south for approximately 0.35 miles before terminating at the intersection with 4th Street in a residential community south of the proposed site. There is no posted speed limit.

Indian School Road is an east-west four-lane road classified as a minor arterial by the City of Scottsdale. There are two (2) lanes in each travelling direction as well as a bicycle lane. Along portions of the road, within the vicinity of the site, there is either a two-way-left-turn lane or a raised median. Indian School Road begins in the Town of Goodyear and continues west until terminating just west of Mesa Drive, before intersection with SR 87. Indian School Road provides direct access to Pima Freeway (Loop 101). The posted speed limit is 35 mph within the vicinity of the site.

Main Street is an east-west two-lane road north of the proposed site. There is one (1) lane in each travelling direction and on-street parking alone both sides of the road for the entire length of roadway. Main Street begins at the Hotel Valley Ho, just west of the site, and continues east for approximately 0.5 miles before terminating at Brown Avenue. There is no posted speed limit.

1st Street is an east-west two-lane road north of the proposed site. There is one (1) lane in each travelling direction and on-street parking along both sides of the road for the entire length of roadway. 1st Street begins at the intersection with 68th Street and continues east until terminating at the bus station east of the site. There is no posted speed limit.

2nd Street is an east-west two-lane road within the vicinity of the site. There is one (1) lane in each travelling direction and on-street parking along both sides of the road for the entire length of roadway. This portion of 2nd Street begins east of the intersection with 68th Street in a residential neighborhood and continues east until terminating at the City of Scottsdale Civic Center. The posted speed limit is 25 mph.

Alley is an east-west road that connects 69th Street to Goldwater Boulevard. Currently, it provides access to the businesses and residential units on the site, and in the future it will provide access to the underground parking garage for residents of the proposed development.

INTERSECTION CONFIGURATION

The intersection of ***Goldwater Boulevard and Indian School Road*** is a signalized four-legged intersection with protected phasing on all approaches of the intersection. The northbound approach consists of one (1) dedicated left-turn lane, one (1) through lane and one (1) shared through/right-turn lane. The westbound approach consists of dual left-turn lanes, one (1) through lane, one (1) shared through/right-turn lane and one (1) bicycle lane. The southbound approach consists of one (1) dedicated left-turn lane, two (2) through lanes and one (1) shared through/right-turn lane. The eastbound approach consists of dual left-turn lanes, two (2) through lanes, a bicycle lane and a dedicated right-turn lane. There are pedestrian cross walks across all legs of the intersection.

The intersection of ***Goldwater Boulevard and Main Street*** is a signalized four-legged intersection with permissive phasing on all approaches and no right-turn-on-red on the eastbound and westbound approaches. The northbound approach consists of one (1) dedicated left-turn, one (1) through lane and one (1) shared through/right-turn lane. The eastbound and westbound approaches consist of one (1) shared left-turn/through/right-turn lane. The southbound approach consists of one (1) dedicated left-turn lane, two (2) through lanes and one (1) shared through/right-turn lane. There are pedestrian cross walks across all legs of the intersection.

The intersection of ***Goldwater Boulevard and 1st Street*** is a two-way stop controlled intersection with stop signs on the eastbound and westbound approaches. The northbound approach consists of one (1) dedicated left-turn lane, one (1) through lane and one (1) shared through/right-turn lane. The westbound approach consists of one (1) shared left-turn/through lane and one (1) dedicated right-turn lane. The southbound approach consists of one (1) dedicated left-turn lane, two (2) through lanes and one (1) shared through/right-turn lane. The eastbound approach consists of one (1) shared left-turn/through/right-turn lane. There are pedestrian cross walks across the east and west legs of the intersection.

The intersection of ***Goldwater Boulevard and Alley*** is a three-legged unsignalized intersection with a stop sign on the eastbound approach. This access only allows right-turns into and out of the alley because of a raised median separating the northbound and southbound approaches. The northbound approach consists of two (2) through lanes. The southbound approach consists of two (2) through lanes and one (1) shared through/right-turn lane. The eastbound approach consists of one (1) right-turn lane.

The intersection of ***Goldwater Boulevard and 2nd Street*** is a two-way stop controlled intersection with stop signs on the eastbound and westbound approaches. The northbound approach consists of one (1) dedicated left-turn lane, one (1) through lane and one (1) shared through/right-turn lane. The westbound approach consists of one (1) shared left-turn/through/right-turn lane and a bicycle lane. The southbound approach consists of one (1) dedicated left-turn lane, two (2) through lanes and one (1) shared through/right-turn lane. The eastbound approach consists of one (1) shared left-turn/through/right-turn lane. There are pedestrian cross walks across the east and west legs of the intersection.

The intersection of ***69th Street and Indian School Road*** is a four-legged unsignalized intersection with stop signs on the northbound and southbound approaches. The southbound approach is an existing driveway that is approximately 50 feet offset from 69th Street to the west. The northbound approach consists of one (1) shared left-turn/through/right-turn lane. The westbound approach consists of one (1) dedicated left-turn lane, two (2) through lanes, one (1) shared through/right-turn lane and a bicycle lane. The southbound approach consists of one (1) shared left-turn/through/right-turn lane. The eastbound approach consists of one (1) dedicated left turn lane, one (1) lane that is indicated to turn into a left-turn lane at the intersection of Goldwater Boulevard and Indian School Road, one (1) through lane, one (1) shared through/right-turn lane and a bicycle lane. There are pedestrian cross walks across the north and south legs of the intersection.

The intersection of ***69th Street and 1st Street*** is a four-legged unsignalized intersection with stop signs on the eastbound and westbound approaches. The eastbound approach connects through to 68th Street, but is offset approximately 55 feet south of the westbound approach. The westbound approach is aligned with an existing driveway to the Hotel Valley Ho, however, this is not considered to be the eastbound approach. All approaches consist of one (1) shared left-turn/through/right-turn lane. There is a pedestrian cross walk across the east and west legs of the intersection.

The intersection of ***69th Street and Alley*** is a three-legged unsignalized intersection with a stop sign on the westbound approach. The northbound approach consists of one (1) shared through/right-turn lane. The westbound approach consists of one (1) shared left-turn/right-turn lane. The southbound approach consists of one (1) shared left-turn/through lane.

The intersection of ***69th Street and 2nd Street*** is a four-legged unsignalized intersection with stop signs on the northbound and southbound approaches. All approaches consist of one (1) shared left-turn/through/right-turn lane. There are pedestrian cross walks across the north and south legs of the intersection.

The existing intersection configurations and traffic control is illustrated in **Figure 2**.

TRAFFIC VOLUMES

CivTech engaged Field Data Services of Arizona, Inc. to record traffic volumes at the proposed study intersections within the project vicinity. Peak hour volume turning movement counts were performed from 7:00-9:00 AM and 4:00-6:00 PM on Tuesday, August 28, 2018 at the following intersections:

- Goldwater Blvd & Alley
- Goldwater Blvd & 2nd St
- Goldwater Blvd & Indian School Rd
- Goldwater Blvd & Main St
- Goldwater Blvd & 1st St
- 69th St & Indian School Rd
- 69th St & Alley
- 69th St & 1st St
- 69th St & 2nd St

The City of Scottsdale recommends a seasonal adjustment factor based on the month the counts were taken in order to get a more accurate representation of traffic in the area. Scottsdale is a popular area for tourism and traffic volumes are considerably lower during summer months. In order to get a better look at typical traffic, a seasonal adjustment factor is applied. For example, if counts were conducted in June, a 3% increase in traffic is added. Counts for this study were conducted on August 28, 2018. For the month of August, a 5% increase in traffic, or a factor of 1.05 is applied to the existing traffic counts.

The observed existing traffic volumes for this study are presented in **Figure 3** for the weekday AM and PM peak hours and the seasonally adjusted volumes are presented in **Figure 4**. Traffic volume data obtained for this study have been included in the **Appendix B**.

CAPACITY ANALYSIS

The concept of level of service (LOS) uses qualitative measures that characterize operational conditions within the traffic stream. The individual levels of service are described by factors that include speed, travel time, freedom to maneuver, traffic interruptions, and comfort and convenience. Six levels of service are defined for each type of facility for which analysis procedures are available. They are given letter designations A through F, with LOS A representing the best operating conditions and LOS F the worst. Each level of service represents a range of operating conditions. Levels of service for intersections are defined within ranges of average control delay per vehicle, the number of seconds a vehicle can expect to wait due to the presence of a traffic control device. **Table 1Table 1** lists the level of service criteria for signalized and unsignalized intersections.

Table 1 – Intersection Level of Service Criteria

Level of Service	Control Delay (sec/veh)	
	Signalized	Unsignalized
A	≤ 10	≤ 10
B	> 10-20	> 10-15
C	> 20-35	> 15-25
D	> 35-55	> 25-35
E	> 55-80	> 35-50
F*	> 80 (or v/c>1)	> 50 (or v/c>1)

Source: Exhibits 19-8, 20-2, 21-8, and 22-8, Highway Capacity Manual 2017

Peak hour capacity analyses were conducted for the study intersections based on existing conditions and traffic volumes. All intersections have been analyzed using the methodologies presented in the *Highway Capacity Manual (HCM) 6th Edition* and using Synchro traffic analysis software. Signal timing during both the AM and PM peak hour for the intersection of Goldwater Boulevard and Indian School Road was provided by the City of Scottsdale via Synchro models. Signal timing for the intersection of Goldwater Boulevard and Main Street was provided by the City of Scottsdale. Existing signal timing sheets for the intersection of Goldwater Boulevard and Main Street are provided in **Appendix C**.

Results of the existing level-of-service analyses are shown in **Table 2** for both peak hours. The analysis worksheets for the existing conditions have been included in the **Appendix D**.

Table 2: Existing Peak Hour Levels of Service

ID	Intersection	Control	Approach	AM	PM
1	69th St & Indian School Rd	2-way stop (NB/SB)	NB Shared SB Shared EB Left WB Left	E F C C	F E C C
2	Goldwater Blvd & Indian School Rd	Signal	NB SB EB WB	D E C D	E D D E
			Overall	**D**	**D**
3	Goldwater Blvd & Main St	Signal	NB SB EB WB	A A E E	A A E E
			Overall	**A**	**A**
4	69th St & 1st St	2-way stop (EB/WB)	NB Shared SB Shared EB Shared WB Shared	A A A A	A A A A
5	Goldwater Blvd & 1st St	2-way stop (EB/WB)	NB Left SB Left EB Shared WB left/thru	A A B C	B A C C
6	69th St & Alley	1-way stop (WB)	WB Shared SB Left	A A	A A
7	Goldwater Blvd & Alley	1-way stop (EB)	EB Right	B	B
8	69th St & 2nd St	2-way stop (NB/SB)	NB Shared SB Shared EB Shared WB Shared	A A A A	A A A A
9	Goldwater Blvd & 2nd St	2-way stop (EB/WB)	NB Left SB Left EB Shared WB Shared	A A C B	B A D C

The results of the existing conditions analysis summarized in **Table 2** indicates that all study intersections operate with acceptable levels of service (LOS D or better), with the exception of the intersections of 69th Street & Indian School Rd, Goldwater Boulevard & Indian School Road and Goldwater Blvd & Main Street.

The unsignalized intersection of **69th Street and Indian School Road** operates poorly during both the AM and PM peak hours on the northbound and southbound approaches. This delay is due to the high wait times of vehicles making northbound left turns and southbound left turns because of the high volume of through traffic on Indian School Road during both peak hours. Extensive delay during either peak hour at minor roads or driveways that intersect major roads is expected. This delay likely does not occur at all times throughout the day.

The signalized intersection of **Goldwater Boulevard and Indian School Road** operates adequately in the AM peak hour, but has an overall intersection delay of 54 seconds in the PM peak hour. The threshold for an adequate level of service is 55 seconds. So it is very near to operating at a poor level of service.

The signalized intersection of **Goldwater Boulevard and Main Street** experiences delay on the eastbound and westbound approaches of the intersection during both the AM and PM peak hours. This delay is present because the signal operates under actuated-coordinated phasing, meaning that the eastbound and westbound green phases are only triggered when a vehicle approaches. Since Main Street is a minor road, very few vehicles approach the intersection from the east or west, so when they do, there is substantial delay. As more traffic uses this road in the future, the eastbound and westbound delay is likely to decrease.

CRASH ANALYSIS

Crash data for the intersection of Goldwater Boulevard and 1st Street was obtained from the City of Scottsdale. Crashes were documented for the past three (3) years from 2015 to 2017. Only five (5) accidents were reported at this intersection over the analysis period. Of all the incidents reported, none resulted in a fatal injury and only one (1) resulted in incapacitating injury for one (1) of the drivers. The crash listings can be found in **Appendix E**. A summary of the crash data is provided in **Table 3**.

Table 3: Crash Data Summary

Intersection	Total	2017	2016	2015	Injury	Fatality	Angle	Sideswipe	Angle percentage	Sideswipe percentage	Pedestrian	Bicycle
Goldwater Blvd & 1st St	5	2	2	1	3	0	3	2	60%	40%	0	1

A review of the results summarized in **Table 3** reveals that the number of crashes reported at the intersection of Goldwater Boulevard and 1st Street does not rise to the level of warranting consideration of a traffic signal based solely on crash experience.

PROPOSED DEVELOPMENT

SITE LOCATION

The proposed Winery Suites development will be located on the southwest corner of Goldwater Boulevard and 1st Street. The site will encompass 0.62 gross acres of land. Currently, the site consists of a professional office and the LDV wine tasting room, the redevelopment is proposed for a mixed-use development with 31 dwelling units and retail space.

SITE DENSITY

Winery Suites redevelopment will consist of a single mixed-use development with ground floor retail and 31 dwelling units with flexible leasing terms. The site will consist of approximately 1,500 square feet of retail on the ground level.

SITE ACCESS

Resident access to the site will be via an underground parking garage with the entrance located in the alley directly south of the site. There will also be on-street parking available in the alley and public parking in the surrounding area available to visitors.

Access A – is located on the south side of the site in the alley directly south of the proposed development. This will be a full movement access and the only access directly onto the site.

The proposed site plan with access is provided in **Figure 5**.

TRIP GENERATION

The potential trip generation for the proposed development was estimated utilizing the Institute of Transportation Engineers (ITE) *Trip Generation Manual, 10th Edition* and *Trip Generation Handbook, 3rd Edition*. The ITE *Trip Generation Manual* contains data collected by various transportation professionals for a wide range of different land uses. The data are summarized in the report and average rates and equations have been established that correlate the relationship between an independent variable that describes the development size and generated trips for each categorized land use. The report provides information for daily and peak hour trips.

The proposed development will consist of approximately 1,500 square feet of ground floor retail space and 26 multi-family dwelling units in a mid-rise building. Since this site is a redevelopment, the existing trips generated were compared to the estimated generated trips. The existing site consists of approximately 1,463 square feet of professional office space and a 1,533 square foot wine tasting room, according to the Maricopa County Assessor. The land use code (LUC) used for the existing office is 710 and the LUC used for the wine tasting room is 931 for a quality restaurant. Although the wine tasting room is not explicitly a quality restaurant, the amount of time that people stay at the establishment and the activities that occur are very similar, meaning that this LUC is an adequate representation of the wine tasting room. For the proposed development,

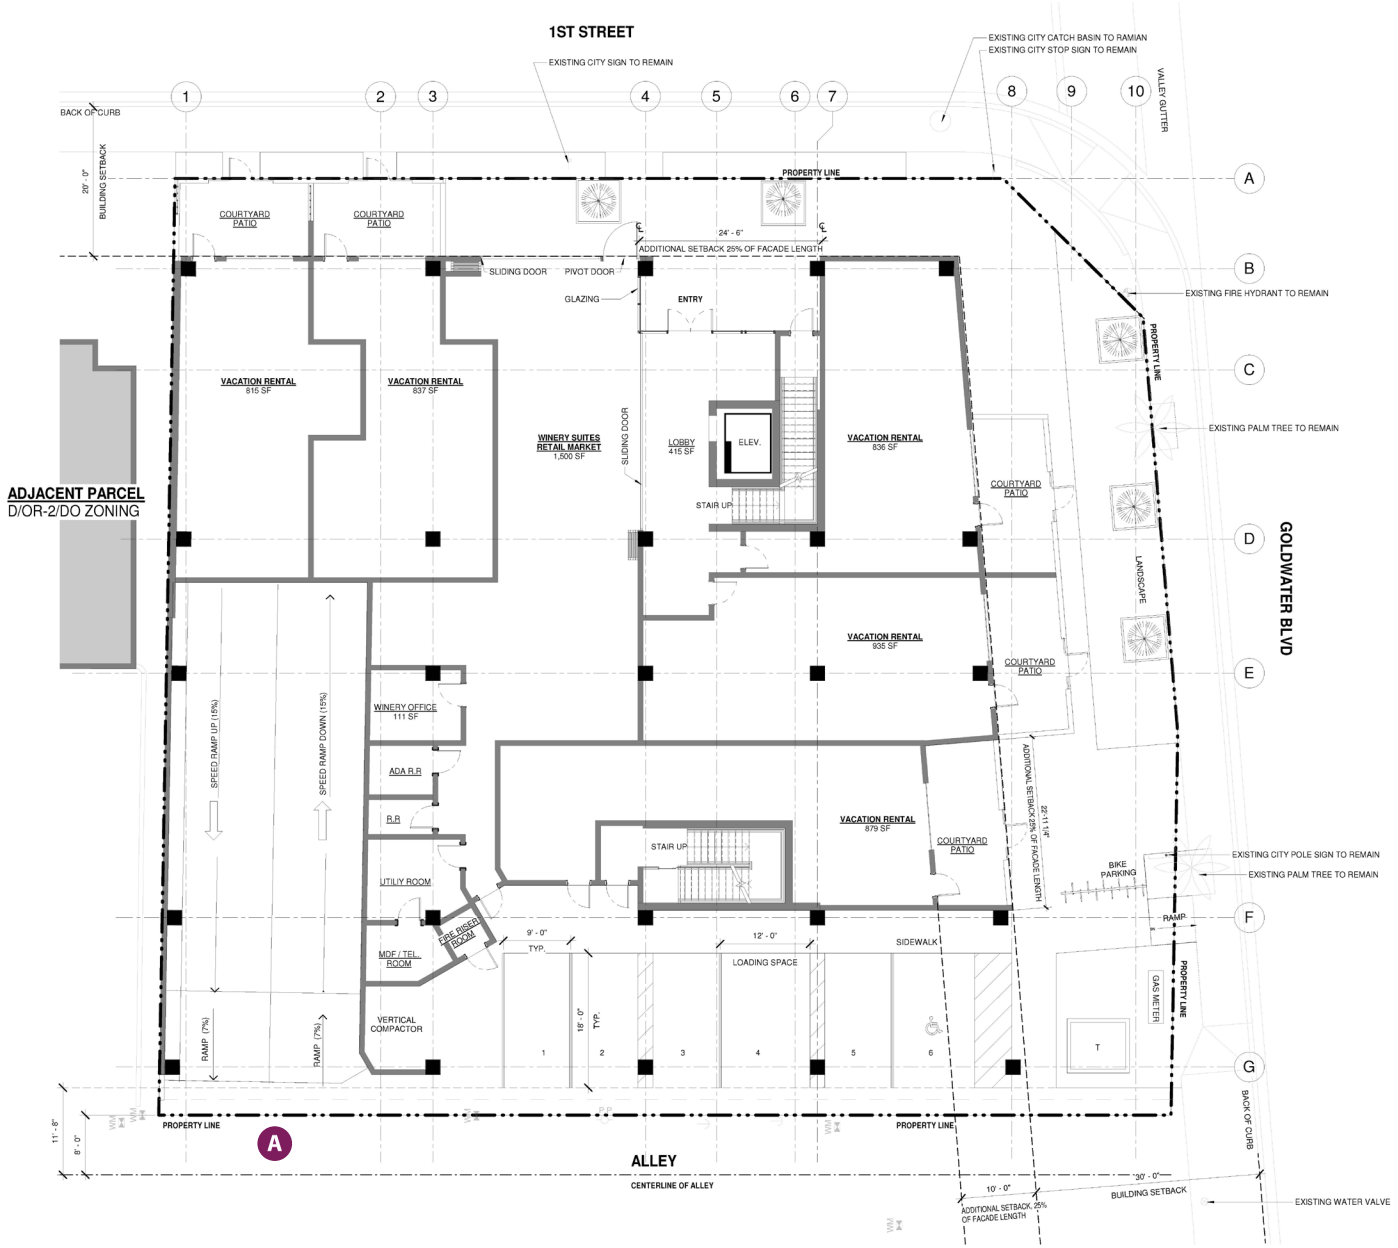

Figure 5: Site Plan and Access

there is a LUC for a mid-rise residential with first-floor commercial, however, since there are very few data points for this LUC and the retail space does not occupy the entire ground floor, it will not be used to analyze this development. The LUC used for the apartments is 221 for mid-rise multi-family and for the retail the LUC 820 was used.

The existing trip generation, using land uses and sizes from the Maricopa County Assessor website, is summarized in **Table 4**. The anticipated trip generation for the Winery Suites development is summarized in **Table 5**. Detailed trip generation calculations are provided in **Appendix F**.

Table 4: Existing Trip Generation

Proposed Use	ITE LUC	Size	Units	Weekday Trips						
				Daily	AM			PM		
				Total	In	Out	Total	In	Out	Total
General Office Building	710	1.463	1,000 square feet	14	2	0	2	0	2	2
Quality Restaurant	931	1.533	1,000 square feet	128	0	1	1	8	4	12
			Subtotals	142	2	1	3	8	6	14

The existing development generates 142 external weekday daily trips, 3 trips during the AM peak hour, and 14 trips during the PM peak hour.

Table 5: Proposed Trip Generation Summary

Proposed Use	ITE LUC	Size	Units	Weekday Trips						
				Daily	AM			PM		
				Total	In	Out	Total	In	Out	Total
Vacation Rental with Flexible Lease Terms	221	34	Rental Units	184	3	9	12	10	6	16
Shopping Center	820	1.500	1,000 square feet	56	1	0	1	3	3	6
			Subtotals	240	4	9	13	13	9	22
Difference From Existing to Proposed				***(98)***	***(2)***	***(8)***	***(10)***	***(5)***	***(3)***	***(8)***

The proposed redevelopment is anticipated to generate 734 external weekday daily trips, 62 trips during the AM peak hour, and 61 trips during the PM peak hour.

The proposed redevelopment is anticipated to generate an additional 592 external daily trips with 59 additional trips in the AM peak hour and an additional 47 trips in the PM peak hour when compared to the trips already generated by existing development.

TRIP DISTRIBUTION AND ASSIGNMENT

A single trip distribution pattern was assumed for the proposed development. It is expected that the proposed development will generate trips based on future employment within a 10-mile radius of the site. Future total employment and population within a 10-mile radius of the site, as predicted by the 2020/2030 socio-economic data compiled by the Maricopa Association of Governments (MAG), was used as a basis to estimate trip distribution. The resulting trip distribution percentages for the study area are shown in **Table 6**. The trip distribution calculations are included in **Appendix G**.

Figure 6 illustrates the trip distribution percentages noted in **Table 6** on the roadway network within the study area. The percentages presented in **Figure 6** were applied to the site trips generated to determine the AM and PM peak hour site traffic at the intersections within the study area.

Table 6: Site Trip Distribution

Direction (To/From)	Percentage
North on Goldwater Blvd (north of Indian School Rd)	9%
East on Indian School Rd (east of Goldwater Blvd)	14%
West on Indian School Rd (west of 69th St)	25%
East on Main St (east of Goldwater Blvd)	2%
East on 2nd St (east of Goldwater Blvd)	3%
West on 2nd St (west of 69th St)	12%
South on Goldwater Blvd (south of 2nd St)	35%
Total	100%

Figure 7 presents the resulting site trip assignment for the proposed development. It should be noted that with access to this site being provided from an alley and not from either of the two public streets through which the alley passes, there is a likelihood of some U-turns occurring at 2nd Street and 1st Street along Goldwater Boulevard. Since the proposed units are meant to be vacation rentals, drivers visiting this site are most likely not familiar with the area and could make U-turns at 2nd Street to head north on Goldwater Boulevard or make U-turns at 1st Street to access the site from Goldwater. These U-turns are not shown on the site trip assignment; until a vacationer becomes familiar with the area, there is always the likelihood that there could be a few U-turns generated by the site at these median breaks.

FUTURE BACKGROUND TRAFFIC

Per the *City of Scottsdale Design Standards & Policies Manual 2018*, for a redevelopment project, such as Winery Suites, the existing site generated volumes need to be subtracted from the existing adjusted traffic volumes to obtain the base traffic that would be present if the existing site were undeveloped. Peak hour site generated traffic volumes for the existing development are presented in **Figure 8**. These volumes were then subtracted from the existing adjusted volumes and the total is presented in **Figure 9**. The volumes presented in this figure represents the base volumes that are present with no development on the site.

CivTech then applied a growth rate to the base volumes to obtain the future background traffic volumes along the adjacent roadway network. In reviewing the City of Scottsdale Traffic Counts Map, a 1.7% average growth rate was found within the proposed study area. **Table 7** shows the expansion factor used for the proposed opening year 2020.

Table 7: Growth Rate Expansion Factors

Horizon Year	Expansion Factor
2020	1.034

Applying the growth rate to the 2018 base traffic volumes predicts the volume of traffic anticipated on the surrounding area roads without the addition of proposed site generated traffic or existing site generated traffic. This growth rate also assumes that the same percentage of overall traffic will remain pedestrians. This calculation assumes that no new roadway improvements are provided on the study area roadways and that the regional road network remains the same. Calculated background traffic for opening year 2020 is presented in **Figure 10**. Background and site traffic calculations worksheets are included in **Appendix H**.

TOTAL TRAFFIC

Total traffic was determined by adding the proposed site generated traffic to the estimated projected background traffic. Total peak hour traffic volumes for the horizon year 2020 are shown in **Figure 11**.

TRAFFIC AND IMPROVEMENT ANALYSIS

INTERSECTION CAPACITY ANALYSIS

Future peak hour capacity analyses have been conducted for the study intersections. All intersections have been analyzed using the methodologies presented in the *Highway Capacity Manual (HCM),* and Synchro 10 as previously described.

Results of the peak hour level-of-service are summarized in **Table 8** for the 2020 opening year. Worksheets for both AM and PM peak hour analyses have been included within **Appendix I** for the 2020 opening year.

Table 8: 2020 Peak Hour Levels of Service

The results of the 2020 peak hour analysis shows that all intersections operate at a level of service LOS D or better with the exception of the following intersections.

The unsignalized intersection of **69th Street and Indian School Road** is expected to continue to operate poorly during both the AM and PM peak hour on the northbound and southbound approaches. Intersections with minor approaches perpendicular to major approaches are expected to operate with delay during certain times of the day when the major road is busy, usually during the peak hour. Due to the location of this intersection to surrounding major intersections and the offset of the driveway from 69th Street, a signal will not be installed at this intersection. If there is significant delay during either peak hour, vehicles will use another route. Mitigation for this intersection is not recommended at this time.

The signalized intersection of **Goldwater Boulevard and Indian School Road** is expected to continue to operate poorly during the PM peak hour during both the no-build and build scenarios. The overall intersection delay during both scenarios is expected to be approximately 56 seconds. The threshold for an acceptable level of service is 55 seconds. Since the overall delay is very close to an acceptable level of service, no mitigation measures are recommended at this time, however, they could become necessary in the future.

The signalized intersection of **Goldwater Boulevard and Main Street** is expected to experience delay on the eastbound and westbound approaches of the intersection during both the AM and PM peak hours. This delay is present because the signal operates under actuated-coordinated phasing, meaning that the eastbound and westbound green phases are only triggered when a vehicle approaches. Since Main Street is a minor road, very few vehicles approach the intersection from the east or west, so when they do, there is significant delay. If more traffic uses this road in the future, the eastbound and westbound delay is likely to decrease.

The proposed lane configurations and stop controls are presented in **Figure 12**.

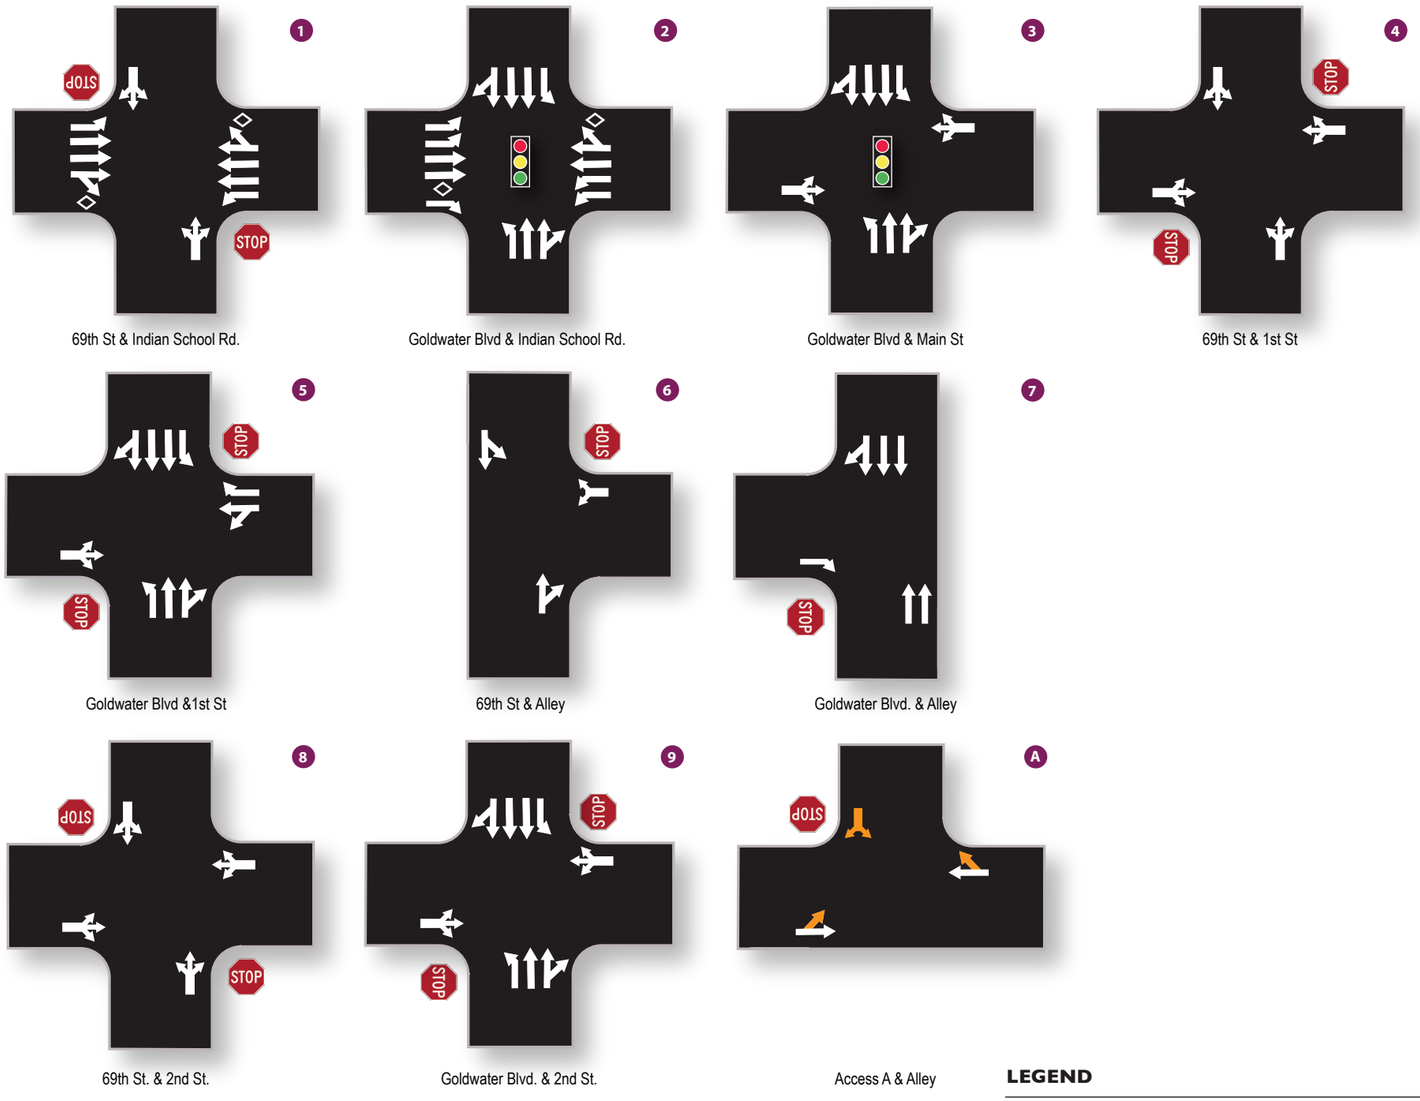
QUEUING ANALYSIS

The site access points were analyzed to determine the storage needed to accommodate the expected traffic volumes for the horizon year 2020 at the left and right turn lanes.

LEFT TURN STORAGE ANALYSIS

Left-turn lanes are required at all street intersections on major collectors and arterials per the City of Scottsdale *Design Standards and Policy Manual* (*DS&PM*). Dual left turn lanes should be considered at intersections in which the peak hour turning volume exceeds 300 vehicles, the opposing volume exceeds 1,000 vehicles per hour or the delay of the left-turns exceeds 45 seconds per section 5-3.123 of the *DS&PM*.

A queuing analysis for left turns was performed for all intersection turn lanes within the study area. The intersections were analyzed to determine the left turn storage needed to accommodate the expected traffic volumes for the horizon year 2020. The formulas used for the calculations are stated below. The resulting left turn lane storage requirements for the 2020 horizon year are summarized in **Table 9**.



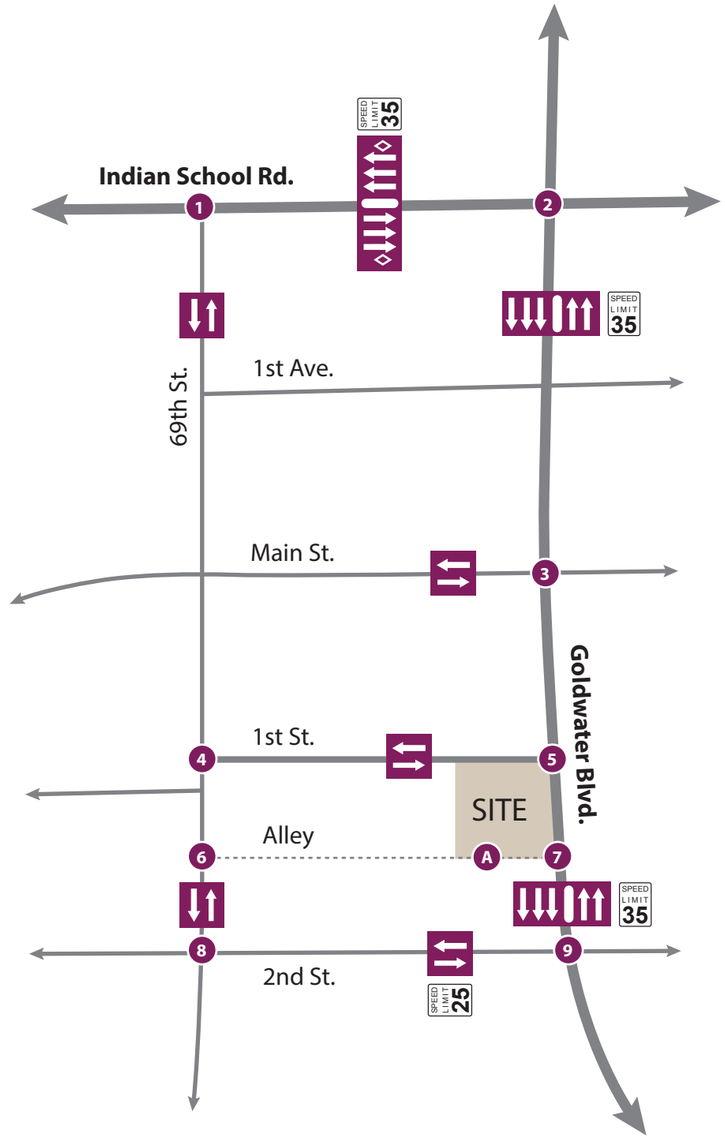


Figure 12: Proposed Lane Configurations and Traffic Controls

Two (2) methods were utilized to calculate the likely queue storage needed at the intersections for the 2032 horizon year. Synchro analysis software provided values for the 50th and 95th percentile queue storage. The 95th percentile has been reported herein. AASHTO also provides the following guidance:

For signalized intersections, the storage length is determined by the following formula:

Storage Length = [2 x (veh/hr)/(cycles/hr)] x 25 feet

For unsignalized intersections, the storage length is determined by the following formula:

Storage Length = [(veh/hr)/(30 periods/hr)] x 25 feet

Queue storage length recommendations at all study intersections herein are based on the 2020 projected traffic volumes.

RIGHT TURN AUXILIARY LANES

Right turn auxiliary lanes are required at all street intersections on major arterials per the City of Scottsdale *DS&PM* section 5-3.206. The standard storage length for a deceleration lane is 150 feet, with a 100-foot minimum length.

DECELERATION LANES

Per the City of Scottsdale *DS&PM*, section 5-3.206, right turn deceleration lanes are generally deemed warranted at a driveway when the following three conditions are satisfied:

- *At least 5,000 vehicles per day are expected to use the adjacent street;*
- *The 85th percentile traffic speed on the adjacent street is 35 MPH or higher, or 45 MPH or higher for a one (1) lane per direction roadway;*
- *At least 30 vehicles will make right turns into a driveway during a peak hour.*

The main access to the site does not meet the requirements listed, meaning that a right turn deceleration lane at the access point to the site is not required, and according to the Synchro analysis performed, it operates at an acceptable level of service under the proposed lane configurations.

Table 9: Queue Length Analysis

ID	Intersection	Intersection Control	Approach	Existing Storage	Synchro 95th %-ile Q	Calculated Storage	Rec. Storage
1	69th St & Indian School Rd.	2-Way Stop (NB/SB)	EB Left	45'	<25'	25'	(1)45'
			WB Left	70'	<25'	50'	(1)70'
2	Goldwater Blvd & Indian School Rd.	Signalized	NB Left	105'	139'	175'	140'
			SB Left	180'	107'	150'	(1)180'
			EB Left	275'	67'	300'	(1) (2)275'
			WB Left	160'	25'	125'	(1) (2)160'
			EB Right	165'	<25'	125'	(1)165'
3	Goldwater Blvd & Main St	Signalized	NB Left	115'	<25'	50'	(1)115'
			SB Left	115'	<25'	50'	(1)115'
9	Goldwater Blvd. & 2nd St.	2-Way Stop (EB/WB)	NB Left	135'	<25'	50'	(1)135'
			SB Left	85'	<25'	25'	(1)85'

(1) Existing turn storage is adequate
(2) Dual left-turn lanes
(3) 50th percentile synchro recommended

As shown in **Table 9**, the existing storage lengths at the existing intersections are anticipated to accommodate the additional traffic generated by the proposed development with the exception of the northbound left turn lane at the intersection of Goldwater Boulevard and Indian School Road. No additional northbound left-turns are expected to be added from site generated traffic, meaning that the number of northbound left-turns is the same for the AM and PM peak hours for the no-build and build scenarios. Additional storage length calculations should be completed prior to traffic signal installation, a change in intersection stop control or installation of raised medians. Turn queue storage length calculations can be found in the **Appendix J**.

SIGHT DISTANCE ANALYSIS

Adequate sight distance must be provided at the intersections to allow safe turning movements into and out of the development. A sight triangle is the area encompassed by the line of sight from a stopped vehicle on the minor roadway to the approaching vehicle on the major roadway: there must be sufficient unobstructed sight distance along both approaches of a street or driveway intersection and across their included corners to allow operators of vehicles to see each other in time to prevent a collision. There must also be sufficient sight distance along the major street to allow a driver intending to turn left into the site to see an oncoming vehicle in the opposing direction.

Sight distance is largely based on the design speed of the roadway. Per the *City of Scottsdale Design Standards and Policies Manual, dated 2018* intersection sight distance should adhere to *Appendix 5-3B. Sight Distance tables in Appendix 5-3B* presents the required sight distance for varying roadway widths and design speeds for passenger cars, single unit trucks and combination trucks. Typically, the posted speed limit is less than the design speed of a roadway. There is no posted speed limit in the Alley. For the purpose of this study, a design speed of 30 mph was used for this road.

The contractor should ensure that adequate sight distance is provided at all site access points to allow safe left and right turning movements from the development. Fixed objects

within the safety triangle cannot be taller than 2.5-feet measured from the adjacent roadway surface (edge of pavement); vegetation should be trimmed to 2.5-feet tall measured form the adjacent roadway surface. Trees placed within the sight triangle shall have canopies no lower than eight (8) feet. It is recommended that sight triangles be designed at all site access driveways to provide the required sight distance shown in *Appendix 5-3B* within the *City of Scottsdale Design Standards and Policies Manual*. Excerpts from the *City of Scottsdale Design Standards and Policies Manual* and tables have been included in **Appendix K**.

CONCLUSIONS

The following conclusions have been documented in this study.

- The results of the existing conditions analysis indicates that all study intersections operate with acceptable levels of service (LOS D or better), with the exception of the intersections of 69th Street & Indian School Rd, Goldwater Boulevard & Indian School Road and Goldwater Blvd & Main Street.
    - Currently, the unsignalized intersection of **69th Street and Indian School Road** operates poorly during both the AM and PM peak hours on the northbound and southbound approaches. This delay is due to the high wait times of vehicles making northbound left turns and southbound left turns because of the high volume of through traffic on Indian School Road during both peak hours. Extensive delay during either peak hour at minor roads or driveways that intersect major roads is expected.
    - The signalized intersection of **Goldwater Boulevard and Indian School Road** currently operates adequately in the AM peak hour, but has an overall intersection delay of 54 seconds in the PM peak hour. The threshold for an adequate level of service is 55 seconds, so it is very near to operating at a poor level of service.
    - The signalized intersection of **Goldwater Boulevard and Main Street** experiences delay on the eastbound and westbound approaches of the intersection during both the AM and PM peak hours. This delay is present because the signal operates under actuated-coordinated phasing, meaning that the eastbound and westbound green phases are only triggered when a vehicle approaches. Since Main Street is a minor road, very few vehicles approach the intersection from the east or west, so when they do, there is substantial delay. As more traffic uses this road in the future, the eastbound and westbound delay is likely to decrease.
- The number of crashes reported at the intersection of Goldwater Boulevard and 1st Street does not rise to the level of warranting consideration of a traffic signal based solely on crash experience. CivTech estimates that the existing development could potentially generate 142 external weekday daily trips, 3 trips during the AM peak hour, and 14 trips during the PM peak hour.
- The proposed redevelopment is anticipated to generate 734 external weekday daily trips, 62 trips during the AM peak hour, and 61 trips during the PM peak hour.
    - As compared to the existing uses, the proposed redevelopment could generate an additional 592 external daily trips with 59 additional trips in the AM peak hour and an additional 47 trips in the PM peak hour.
- The results of the 2020 peak hour analysis shows that all intersections operate at a level of service LOS D or better with the exception of the following intersections.

- The unsignalized intersection of **69th Street and Indian School Road** is expected to continue to operate poorly during both the AM and PM peak hour on the northbound and southbound approaches. Intersections with minor approaches perpendicular to major approaches are expected to operate with delay during certain times of the day when the major road is busy, usually during the peak hour. Due to the location of this intersection to surrounding major intersections and the offset of the driveway from 69th Street, a signal will not be installed at this intersection. If there is significant delay during either peak hour, vehicles will use another route. Mitigation for this intersection is not recommended at this time.

- The signalized intersection of **Goldwater Boulevard and Indian School Road** is expected to continue to operate poorly during the PM peak hour during both the no-build and build scenarios. The overall intersection delay during both scenarios is expected to be approximately 56 seconds. The threshold for an acceptable level of service is 55 seconds. Since the overall delay is very close to an acceptable level of service, no mitigation measures are recommended at this time, however, they could become necessary in the future.

- The signalized intersection of **Goldwater Boulevard and Main Street** is expected to experience delay on the eastbound and westbound approaches of the intersection during both the AM and PM peak hours. This delay is present because the signal operates under actuated-coordinated phasing, meaning that the eastbound and westbound green phases are only triggered when a vehicle approaches. Since Main Street is a very small road, very few vehicles approach the intersection from the east or west, so when they do, there is significant delay. If more traffic uses this road in the future, the eastbound and westbound delay is likely to decrease.

- The existing storage lengths at the existing intersections are anticipated to accommodate the additional traffic generated by the proposed development with the exception of the northbound left turn lane at the intersection of Goldwater Boulevard and Indian School Road. No additional northbound left-turns are expected to be added from site generated traffic, meaning that the number of northbound left-turns is the same for the AM and PM peak hours for the no-build and build scenarios. Additional storage length calculations should be completed prior to traffic signal installation, a change in intersection stop control or installation of raised medians.

- The contractor should ensure that adequate sight distance is provided at all site access points to allow safe left and right turning movements from the development. It is recommended that sight triangles be designed at all site access driveways to provide the required sight distance shown in *Appendix 5-3B* within the *City of Scottsdale Design Standards and Policies Manual*.

REVIEW COMMENTS AND RESPONSES

Disposition Codes: (1) Will Comply (2) Will Evaluate (3) Delete Comment (4) Defer to Consultant/Owner

Reviewer Name, Agency: **Greg Bloemberg, City of Scottsdale**

Item	Review Comment	(Code) & Response
1.	Please revise TIMA to include current traffic counts for link volumes along Goldwater Blvd, 69th Street, and 2nd Street.	(3) The original TIMA included average daily total (ADT) volumes on the vicinity maps included in each figure. These volumes were estimated using the peak hour turning movement counts. Including existing link volumes as the ADT volumes would not change the values substantially.
2.	The report should address site access as it related to the limited access at Goldwater Blvd. and the likelihood of generating U-turns at 2nd Street and 1st Street as drivers enter and exit the site. As these are rental units, there is a higher likelihood of drivers unfamiliar with local streets.	(1) Text has been added to the report indicating that U-turns are likely to occur at 1st Street and 2nd Street along Goldwater due to the nature of the proposed site and the out of town visitors that the site will attract.

APPENDIX F

TRIP GENERATION

Methodology Overview

This form facilitates trip generation estimation using data within the Institute of Transportation Engineer's (ITE) *Trip Generation Manual* , 10th Edition and methodology described within ITE's *Trip Generation Handbook* , 3rd Edition. These references will be referred to as *Manual and Handbook* , respectively. The *Manual* contains data collected by various transportation professionals for a wide range of different land uses, with each land use category represented by a land use code (LUC). Average rates and equations have been established that correlate the relationship between an independent variable that describes the development size and generated trips for each categorized LUC in various settings and time periods. The *Handbook* indicates an established methodology for how to use data contained within the Manual when to use the fitted curve instead of the average rate and when to adjustments to the volume of trips are appropriate and how to do so. The methodology steps are represented visually in boxes in Figure 3.1. This worksheet applies calculations for each box if applicable.

Box 1 - Define Study Site Land Use Type & Site Characteristics

The analyst is to pick an appropriate LUC(s) based on the subject's zoning/land use(s)/future land use(s). The size of the land use(s) is described in reference to an independent variable(s) specific to (each) the land use (example: 1,000 square feet of building area is relatively common).

Land Use Types and Size

Proposed Use	Amount	Units	ITE LUC	ITE Land Use Name
General Office Building	1.463	1,000 square feet	710	General Office Building
Quality Restaurant	1.533	1,000 square feet	931	Quality Restaurant

Box 2 - Define Site Context

Context assessment is to "simply determine whether the study sites is in a multimodal setting" and "could have persons accessing the site by walking, bicycling, or riding transit."
This assessment is used in Box 4. The *Manual* separates data into 4 setting categories - **Rural, General Urban/Suburban**, **Dense Multi-Urban Use** and **Center City Core**.
This worksheet uses the following abbreviations, respectively: ***R*** , ***G*** , ***D*** , and ***C*** . The *Manual* does not have data for all settings of all land use codes. See the table on the next page titled "Site Context and Time Periods" - if this table is not provided, the "General Urban/Suburban" setting is used by default.

Box 3 - Define Analysis Objectives Types of Trips & Time Period

This tool will focus on vehicular trips for a 24-hour period on a typical weekday as well as its AM peak hour and PM peak hour. Other time period(s) may be of interest.

Box 4 - Is Study Site Multimodal?

Per the Handbook, "if the objective is to establish a local trip generation rate for a particular land use or study site, the simplified approach (Box 9) may be acceptable but the *Box 5 through 8* approach is required if the study site is located in an infill setting, contains a mix of uses on-site, or is near significant transit service."

Box 5/Box 9 - Estimate Baseline Trips/Estimate Vehicular Trips (Determine Equation)

Vehicle trips are estimated using rates/equations applicable to each LUC. When the appropriate graph has a fitted curve, the *Handbook* has a process (Figure 4.2) to determine when to use it versus using the weighted average rate or collecting local data. The methodology requires for engineering judgement in some circumstances and permits engineering judgement to override or make adjustments when appropriate to best project (example 1: study site is expected to operate differently than data in the applicable land use code - such as restaurant that is closed in the morning or in the evening; example 2: LUC data in a localized area fails to be represented by the typically selected fitted curve/weighted average rate - a small shop/LUC 820, AM peak hour is skewed by the high y-intercept).

Weighted Average Rate ("WA"), Fitted Curve ("FC"), or Custom ("C") Used in Analysis?

Proposed Use	ADT Equation [Equated Rate]	AM Equation [Equated Rate]	PM Equation [Equated Rate]	(not used)
General Office Building	WA: T=X*9.74 [9.74]	WA: T=X*1.16 [1.16]	FC: LN(T)=0.95*LN(X)+0.36 [1.41]	
Quality Restaurant	WA: T=X*83.84 [83.84]	WA: T=X*0.73 [0.73]	WA: T=X*7.8 [7.80]	

Box 5/Box 9 - Estimate Baseline Trips/Estimate Vehicular Trips (Apply Equations and in/out Distributions)

Baseline Vehicular Trips

	ADT				AM				PM				(not used)
Proposed Use	% In	In	Out	Total	% In	In	Out	Total	% In	In	Out	Total	
General Office Building	50%	7	7	14	86%	2	0	2	16%	0	2	2	
Quality Restaurant	50%	64	64	128	0%	0	1	1	67%	8	4	12	
Totals		**71**	**71**	**142**		**2**	**1**	**3**		**8**	**6**	**14**	

Methodology Overview

This form facilitates trip generation estimation using data within the Institute of Transportation Engineer's (ITE) *Trip Generation Manual*, 10th Edition and methodology described within ITE's *Trip Generation Handbook*, 3rd Edition. These references will be referred to as *Manual and Handbook*, respectively. The *Manual* contains data collected by various transportation professionals for a wide range of different land uses, with each land use category represented by a land use code (LUC). Average rates and equations have been established that correlate the relationship betwee an independent variable that describes the development size and generated trips for each categorized LUC in various settings and time periods. The *Handbook* indicates an established methodology for how to use data contained within the Manual when to use the fitted curve instead of the average rate and when to adjustments to the volume of trips are appropriate and how to do so. The methodology steps are represented visually in boxes in Figure 3.1. This worksheet applies calculations for each box if applicable.

Box 1 - Define Study Site Land Use Type & Site Characteristics

The analyst is to pick an appropriate LUC(s) based on the subject's zoning/land use(s)/future land use(s). The size of the land use(s) is described in reference to an independent variable(s) specific to (each) the land use (example: 1,000 square feet of building area is relatively common).

Land Use Types and Size

Proposed Use	Amount	Units	ITE LUC	ITE Land Use Name
Apartments	26	Dwelling Units	221	Multifamily Housing (Mid-Rise)
Shopping Center	1.482	1,000 square feet	820	Shopping Center
High Turnover (Sit Down) Restaurant	5.454	1,000 square feet	932	High Turnover(Sit Down) Restaurant

Box 2 - Define Site Context

Context assessment is to "simply determine whether the study sites is in a multimodal setting" and "could have persons accessing the site by walking, bicycling, or riding transit."
This assessment is used in Box 4. The *Manual* separates data into 4 setting categories - **Rural, General Urban/Suburban**, **Dense Multi-Urban Use** and **Center City Core**.
This worksheet uses the following abbreviations, respectively: ***R***, ***G***, ***D***, and ***C***. The *Manual* does not have data for all settings of all land use codes. See the table on the next page titled "Site Context and Time Periods" - if this table is not provided, the "General Urban/Suburban" setting is used by default.

High Turnover (Sit Down) Restaurant	General Urban/Suburban	G	G	G	G	G	G	G		

If the desired setting is not available within the *Manual,* adjustments may be made in Boxes 6 through 8.

Box 4 - Is Study Site Multimodal?

Per the Handbook, "if the objective is to establish a local trip generation rate for a particular land use or study site, the simplified approach (Box 9) may be acceptable but the *Box 5 through 8* approach is required if the study site is located in an infill setting, contains a mix of uses on-site, or is near significant transit service."

Box 5/Box 9 - Estimate Baseline Trips/Estimate Vehicular Trips (Determine Equation)

Vehicle trips are estimated using rates/equations applicable to each LUC. When the appropriate graph has a fitted curve, the *Handbook* has a process (Figure 4.2) to determine when to use it versus using the weighted average rate or collecting local data. The methodology requires for engineering judgement in some circumstances and permits engineering judgement to override or make adjustments when appropriate to best project (example 1: study site is expected to operate differently than data in the applicable land use code - such as restaurant that is closed in the morning or in the evening; example 2: LUC data in a localized area fails to be represented by the typically selected fitted curve/weighted average rate - a small shop/LUC 820, AM peak hour is skewed by the high y-intercept).

Weighted Average Rate ("WA"), Fitted Curve ("FC"), or Custom ("C") Used in Analysis?

Proposed Use	ADT Equation [Equated Rate]	AM Equation [Equated Rate]	PM Equation [Equated Rate]	(not used)
Apartments	FC: T=5.45*X-1.75 [5.38]	FC: LN(T)=0.98*LN(X)-0.98 [0.35]	FC: LN(T)=0.96*LN(X)-0.63 [0.47]	
Shopping Center	WA: T=X*37.75 [37.75]	WA: T=X*0.94 [0.94]	WA: T=X*3.81 [3.81]	
High Turnover (Sit Down) Restaurant	WA: T=X*112.18 [112.18]	WA: T=X*9.94 [9.94]	WA: T=X*9.77 [9.77]	

Box 5/Box 9 - Estimate Baseline Trips/Estimate Vehicular Trips (Apply Equations and in/out Distributions)

Baseline Vehicular Trips

	ADT				AM				PM				(not used)
Proposed Use	**% In**	**In**	**Out**	**Total**	**% In**	**In**	**Out**	**Total**	**% In**	**In**	**Out**	**Total**	
Apartments	50%	70	70	140	26%	2	7	9	61%	7	5	12	
Shopping Center	50%	28	28	56	62%	1	0	1	48%	3	3	6	
High Turnover (Sit Down) Restaurant	50%	306	306	612	55%	30	24	54	62%	33	20	53	
Totals		**404**	**404**	**808**		**33**	**31**	**64**		**43**	**28**	**71**	

Box 6 - Convert Baseline Vehicle Trips to Person Trips

If no vehicle trip reductions are to be applied, this portion may be ignored. The *Handbook* states "There are not enough samples to derive precise percentages by mode...however, for all but on ...the motor vehicle percentage of total person trips is at least 96 percent." and "[vehicle occupancy for] many of the most commonly analyzed land use codes are not [available]." This form assumes that the total baseline vehicle trips for all land use codes accounts fo 90% of total person trips. Unless otherwise specified, this form later reverses the conversion in Box 8.

Box 7 - Estimate Internal Person Trips, External Walk/Bike Trips, Transit Person Trips, External Person Trips (Internal Capture)

Internal capture occurs for mixed-use developments when a portion of the trips generated by the site are expected to have the both the origin and destination within the site. Internal capture is not dependent on mode choice. The reduction is applied as a percent of vehicular trips removed from the baseline trips.

Adjustments for Internal Trips

	ADT				AM				PM				(not used)
Proposed Use	**Percent**	**In**	**Out**	**Total**	**Percent**	**In**	**Out**	**Total**	**Percent**	**In**	**Out**	**Total**	
Apartments	9%	7	7	14	3%	0	0	0	15%	2	0	2	
Shopping Center	9%	3	3	6	3%	0	0	0	15%	0	2	2	
High Turnover (Sit Down) Restaurant	9%	31	31	62	3%	0	2	2	15%	6	2	8	
Totals		**41**	**41**	**82**		**0**	**2**	**2**		**8**	**4**	**12**	

Box 8 - Convert Person Trips to Final Vehicle Trips

The vehicle occupancy and baseline alternate mode are now factored out from the external trips in vehicles, after any adjustments for internal capture and additional alternate mode from Box 7. In Box 6, vehicle trips were considered to account for 90% of total person trips. Alternate mode trips in addition to the baseline, if any, are accounted for in Box 7. It is estimated that vehilcle trips should be reduced by an additional 0% due to carpooling. The final external trips in vehicles is multiplied by 90%-0%= 90% to produce the external vehicle trips.

External Vehicular Trips

Notes: [1]
Cross section assumed to include a 12' median/center lane and 6' bike lane
TH = Through Movement, LT = Turn Movement
All distances given in feet
Design speed by roadway classification is shown in Appendix 5-3A
For cross sections deviating from the tabulated configurations, refer to the AASHTO Geometric Design of Highways and Streets (current editions) for additional information
