From: Mike Leary
Subject: **DC Ranch Park – shared stormwater detention basin**

Colleagues, I hope that you view my following comments as nothing more than an opportunity to solve a significant drainage problem to the City's benefit and not an attempt to obfuscate the plans for constructing post-haste the Bell Road Sports Complex. I understand the City's objective to have the fields ready for parking the January 2022 Barrett-Jackson auction. However, I am concerned that the rush might overlook the opportunity to accomplish significantly more than just the proposed lake in DC Ranch Park.

As background I was the development coordinator for the Hampton Group which acquired the adjoining 125-acre ASLD lease back in 2007 (and defaulted in 2009). As part of the EPICENTER infrastructure master planning by the engineering firm of Coe & Van Loo, it was discovered that the existing 100-year flow through the culverts at the northeast corner of Bell Road and the Pima Freeway far exceeded its capacity. The culvert has a 100-year capacity between 900 and 1,000 cfs but incoming flows between 1,400 and 1,700 cfs. In essence during a 100-year event the intersection and the up and downstream properties will be flooded and the City might be liable for damages as a result of not having rectified the problem that they have been aware of since 2008.

The use of the DC Ranch Park site to mitigate the significant overage was first approved with the Epicenter Master Drainage Plan in 2008. A highlighted abstract of the Executive Report is below:

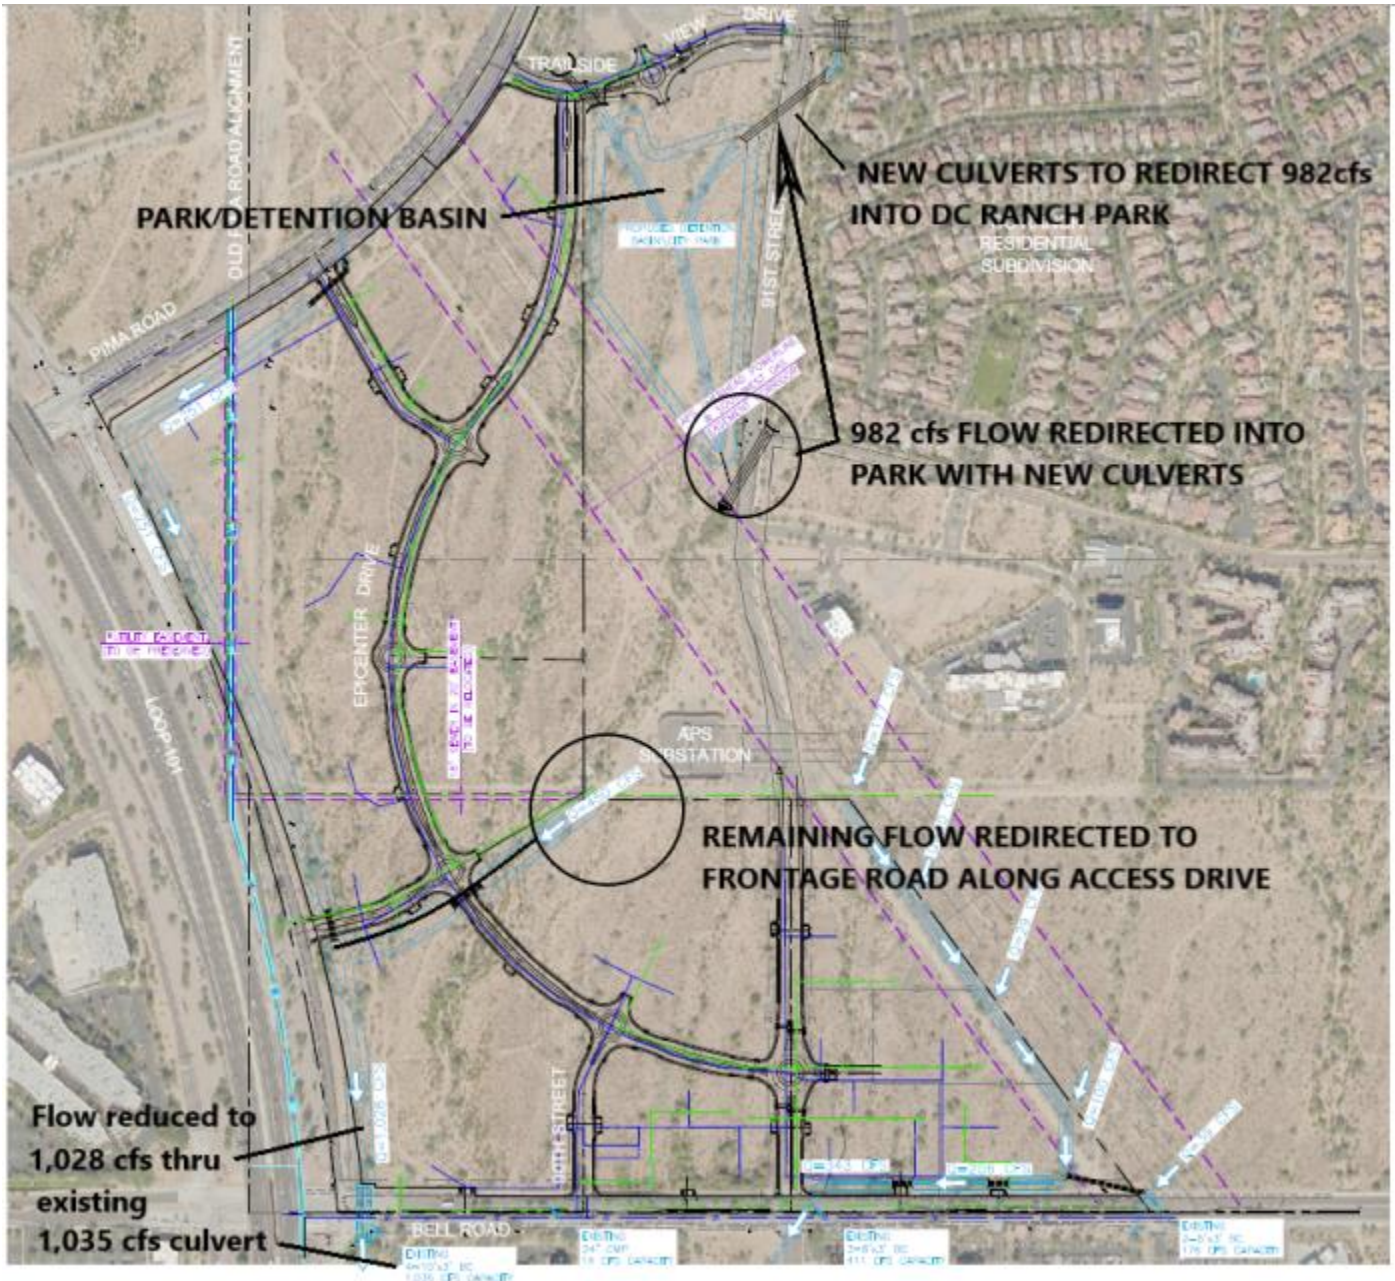

2.0 SCOTTSDALE EPICENTER UPSTREAM DRAINAGE BACKGROUND

In order to gain understanding of the upstream watershed for the site, CVL referred to the drainage reports for DC Ranch (Reference 1) and the Preliminary Drainage Design Report for the Pima Road Realignment Project (Reference 2). According to these reports, the 100-year off-site flows of 491 cfs (CP-C1B), 993 cfs (CP-CC2E), and 251 cfs (CP1MA3) are directed through the site toward a four-barrel, 10-foot by 3-foot box culvert located at Bell Road immediately east of the Loop 101 frontage road. In addition, 300 cfs (CP-API1) from the site itself is directed to the same culvert under the existing non-developed site conditions. Refer to Plate 1 for the location of the HEC-1 concentration points.

In order to calculate the existing 100-year 6-hour flow upstream of the above mentioned box culvert, CVL combined the DC Ranch contributing drainage area, the Pima Road contributing drainage area, and the site's existing condition contributing drainage area in a HEC-1 model and included it within the approved Master Drainage Report for Scottsdale Epicenter (Reference 3). The box culverts, as well as the downstream channel and two additional culvert crossings south of Epicenter, were designed to carry a 100-year flow of 1,035 cfs (References 4 & 5). The 100-year 6-hour flow in the existing condition box culverts is 1,719 cfs (Reference 3). This flow exceeds the capacity of the culvert as well as the channel and three other downstream culverts, causing a potential flood hazard for Scottsdale Epicenter, Bell Road, and properties downstream of Bell Road.

In order to eliminate the flood hazard described above, the City of Scottsdale has agreed to use the future DC Ranch Park (hereafter referred to as the "City of Scottsdale Park"), located at the southwest corner of the intersection of 91st Street and Trailside View Drive, as a detention basin to attenuate the upstream peak flows. Initially, 55 acre-feet of volume was proposed to be detained in this park to reduce the proposed condition 100-year peak flow at the upstream end of the Bell Road culverts to less than 1,035 cfs (Reference 3).

Below is a graphic from Coe & Van Loo illustrating the use of the park as a detention basin to mitigate the existing 100-year flooding (comments in black are mine):

In December 2017 I represented another group wanting to purchase the same ASLD property and had a formal pre-application meeting with City department staff. The use of DC Ranch Park for a drainage basin was reconfirmed by Stormwater’s Ashley Couch. If the upstream flow isn’t mitigated, the existing 1,400 to 1,700 flow will simply be conveyed through the ASLD property to the undersized Bell Road culverts with the City continuing to have the flooding problem to solve or not to solve.

The latest timeline from ASLD is that the north and south half of the 125-acres will be auctioned the first and second quarter of 2021. For a second time I am the development coordinator for the applicant on the south parcel and part of our the diligence is to confirm again that the DC Ranch Park is available for detention as previously approved.

The point of my letter is to make decision-makers aware that the plan below to construct a first phase lake does not address how the lake and other park improvements work with the long-planned and needed detention basin.

If the park is developed without consideration of the detention basin, the lake/waterlines/site improvements may need to be relocated or reconstructed which would be unnecessary, avoidable and costly. Detention basins for park facilities have been a common and successful dual-use throughout the City. In this case, there might also be another opportunity for a nominal amount of event parking for the January events.

There may be a similar opportunity for dual-use of the Bell Road Fields to absorb some of the flow from the existing wash on the east side thereby reducing the flows into Westworld.

In summary there are multiple benefits to be considered. The City still gets its lake for the Bell Sports Complex. The City eliminates the existing flooding hazard and liability at the Bell/101 culverts. DC Ranch gets greater and earlier park improvements. The January seasonal parking might get to use some portion of the 14-acre park site. All of these benefits could be achieved less expensively if coordinated and not disjointed.

So there's my thoughts. I'm copying quite a few folks so that everyone has the same information. Hope this helps. ML

TECHNICAL MEMORANDUM

To: City of Scottsdale
From: HILGARTWILSON
Date: March 13th, 2017
RE: Great Hearts Academies – Scottsdale Preparatory Field Preliminary Drainage Analysis

Introduction and Background

This technical memorandum has been prepared in support of the Great Hearts Academies (GHA) proposed athletic field (the Project) located southwest of Trailside View and 91st Street, east of Pima Road and the 101 Highway, in the City of Scottsdale (the City). Refer to Figure 1 (Vicinity Map). Specifically, this memorandum discusses the regulatory framework in which the Project will be designed in accordance with as well as preliminary drainage considerations.

Future drainage reports will be prepared in accordance with the most current version of the City of Scottsdale (COS) Design Standards & Policies Manual (DSPM) and the Flood Control District of Maricopa County's (FCDMC) current versions of the Drainage Policies and Standards (DPSM), Drainage Design Manuals (DDM) for Maricopa County, - Hydrology and - Hydraulics.

Hydrologic Flow Determination

In July 2013, T.Y. Lin prepared the *Pinnacle Peak South Area Drainage Master Study Draft* (ADMS) (T.Y. Lin 2013) on behalf of the FCDMC that details the hydrologic and hydraulic conditions of a 45 square mile drainage area extending from Frank Lloyd Wright Boulevard to Dynamite Boulevard and from Scottsdale Road into the McDowell Mountains. The primary goal of the study was to characterize regional flows using the most up to date hydrologic study of the watershed referencing the most current land uses, rainfall data, detailed topography, and analysis. The hydrologic and hydraulic analysis for the study area was completed using FLO-2D, a volume conserving, two-dimensional flood routing modeling program best suited for simulating shallow, distributary flows within a watershed. The ADMS reported a worst case scenario flow of 488 cfs entering the northwest corner of the Project via box culverts beneath, as well as overtopping, Trailside View from the north. The ADMS also reported smaller flows for the 100-year, 6-hour and 24-hour events of 217cfs and 257cfs respectively. FLO-2D results from the ADMS are included as Attachment 1.

Site Location Relative to Known FEMA Flood Hazard Zones

The property is located within the Federal Emergency Management Agency's (FEMA) Special Flood Hazard Area (SFHA) Zone AO as delineated on the FEMA Flood Insurance Rate Maps (FIRMs) panel number O4013C1320L, revised October 16, 2013, which are presented on Figure 2 (FEMA Flood Map). The SFHA Zone associated with this Project is defined below.

Zone AO:

The flood insurance rate zone that corresponds to areas subject to inundation by 1-percent annual chance (100-year storm event) shallow flooding (usually sheet flow on sloping terrain) where average depths are between one and three feet. Average flood depths derived from detailed hydraulic analyses are shown in this zone.

As the entire Project is located in a FEMA SFHA AO Zone, lowest floor elevations of nonresidential structures shall be elevated to conform to Chapter 37, Article I. Floodplain Management - Special Flood Hazard Areas, Section 37-22 of the Scottsdale Revised Ordinance Code.

Hydraulic Analysis

The 100-year water surface extents of the watercourse through the site were determined in order to identify the anticipated flooding impacts to the proposed field. The preliminary hydraulic analyses for the Project was performed using Hydraflow with parameters referenced from obtained topographic data for the Project. The top widths specified in the Hydraflow results were used to delineate the washes approximate water surface extents. The supporting hydraulic calculations are included as Attachment 2 and the estimated watersurface extents shown on Figure 3 (Drainage Summary Exhibit). It can be seen that based on the current field and parking lot layout, the worst case scenario flows crossing Trailside View do not impact the Project.

Onsite Design Requirements

The proposed Project will comply with the City's required drainage standards as well as Maricopa County Planning and Development Design guidelines and regulations. In accordance with the approved regional drainage report entitled DC Ranch Planning Unit I Part 4 Drainage Plan Study and stormwater storage waiver for the site, onsite stormwater storage is not anticipated to be required.
