## **1. Introduction**

The Megerdichian Assisted Seniors Center (MASC) is located within a portion of Lot 3 in the Southwest Quarter of Section 19, Township 3 North, Range 5 East of Gila and Salt River base and Meridian, Maricopa County, Arizona. The site is bordered on the west by Pima Freeway, on north by Cholla Street, and on the east and south by previously developed properties. The current zoning of the site is R1-35 according to Maricopa County Assessor's Office. Currently, the site includes several parking lots and paved driveways, three single story buildings which are connected by a dirt road, and a retention area. The remaining portion on the north of the site is open space area which the proposed development will occur on. The proposed development includes a 78 unit senior center building (92,436 sf), and the required parking spaces.

Please see Vicinity Map below.

An existing 30" DIP public water and 24" PVC public sewer are located along the west property boundary. Please refer to "Appendix C - Sewer and Water Quarter Section Map" for detailed information.

## **2. Water System**

With respect to the water line design, it is planned to service the new building by connecting the new water line to the existing 8" ACP water line along Cholla Street by replacing the existing 6" connection with an 8" connection. The new 8" public waterline will be looped through the site and connect back to the 6" public water line on the west side of the site. The new building domestic water supply and fire sprinkler feed will be tapped off the new loop. In addition, this new water line will feed the fire hydrants in two locations on the southwest and southeast side of the new senior center building. The existing senior living buildings will continue to be fed by the existing services.

It is worth mentioning that the existing water line which crosses the proposed senior center building will be completely removed and the new building will be serviced via the mentioned water line.

Please see Appendix A for Water Calculations and Appendix C for Preliminary Water and Sewer Plan.

## **3. Sewer Distribution System**

The site will be serviced by an existing 8" sewer stub that connects to the existing 24-inch public sewer line along the west boundary of the property. Currently the 8" sewer stub services the existing south building with a 6" sewer service. This sewer service will be removed and rerouted to avoid the new building. It is anticipated that a 6" sewer line will provide enough capacity for the proposed building based on 78 dwelling units. The details of the building service lines will be provided by the plumbing engineer at the time of final design. The new and existing building sewer will combine at the existing 8" sewer stub.

Please see Appendix B for Sewer Calculations and Appendix C for Preliminary Water and Sewer Plan.

## **APPENDIX A**

### **Water Calculations**

## Water Demand Calculations

The proposed water system was designed to handle the peak hourly demand of the site. The flow design method and criteria are in accordance with City of Scottsdale design standard. The average daily water demand as well as the peak demand were estimated by using the City of Scottsdale “2018 Design Standards & Policies Manual, Figure 6-1.2 Average Day Water Demands” as follow:

### Domestic Water Demand

Number of units for proposed building:

78

Average day demand per room:

$$0.63 \text{ gpm} \text{ Average day demand} = 78 \times 0.63 = 49.14 \text{ gpm}$$

Maximum daily peaking factor:

2.0

Maximum daily demand per dwelling unit:

1.26 gpm

$$\text{Maximum day demand} = 78 \times 1.26 = 98.28 \text{ gpm}$$

Peak hour demand factor:

3.5

Peak hour demand per dwelling unit:

2.205 gpm

$$\text{Peak hour demand} = 78 \times 2.205 = 171.99 \text{ gpm}$$

The plumbing engineer will size the domestic water meter at the time of final design.

### FIRE FLOW DEMAND

The proposed fire line system was designed to meet 2012 International Fire Code and the City of Scottsdale design criteria. The system was designed based on the area and construction type of the main apartment building as follow:

Area of the New Building: 92,436 sf

Construction Type: II-A, → Fire Flow = 4,500 gpm

Per 2012 International Fire Code, Appendix B, Section B105.2 a 75% reduction in the fire flow can be approved if an approved automatic sprinkler system is installed. The resulting fire flow shall not be less than the required minimum of 1,500 gpm. We are using a fire flow of 1,500 gpm since a 75% reduction would be less than the minimum required fire flow.

Fire Flow:  $(4,500 \text{ gpm}) \times 0.25 = 1,125 \text{ gpm} < 1,500 \text{ gpm} \rightarrow \text{Fire Flow} = 1,500 \text{ gpm}$

Per the City of Scottsdale, the system is required to provide the fire flow during the peak day demand. Therefore, the design fire flow is:

**Design Fire Flow = 1,500 gpm + 171.99 gpm = 1,671.99 gpm**

To examine the existing water system, a flow-pressure test was conducted by Arizona Flow Testing LLC along the north property line in Cholla Road. According to the raw flow test results, the static pressures was 76.0 with a residual pressure of 49.0 PSI flowing 1,504 GPM. The results from the fire flow test were put into the Anvil Fire - Flow Test Graph to determine the residual pressure at the fire flow demand as well as peak hour demand. The Anvil Fire - Flow Test Graph provides a N1.85 Logarithmic Graph based on NFPA 291 recommendations. Based on the Anvil Fire - Flow Test Graph a peak hour demand and fire flow demand of 1,671.99 gpm results in a residual pressure of 43 psi. Please see attached fire flow test result and Anvil Fire - Flow Test Graph included in this report.

The resulting 43 psi was then converted to head (ft) as shown in pressure conversion equation attached to the end of this appendix. The conversion of 43 psi equated to a pressure heads of 99 ft. To model the system, Bentley WaterCAD V8 XM Edition was used. The proposed domestic and fire systems were modeled using a reservoir with the head elevation applied at the connections to the existing public water main. All minor friction losses due to fittings were included in the analysis.

Per modelling results for the proposed water line, the peak hour demand and fire demand of 1,671.99 gpm resulted in a pressure of 33 psi at the most remote fire hydrant H-1 and 42 psi at fire hydrant H-2. Therefore, the proposed public water main has the required capacity to service the proposed development. Please see the following documents for the detailed test results and model.

### Logarithmic Graph of Water Supply

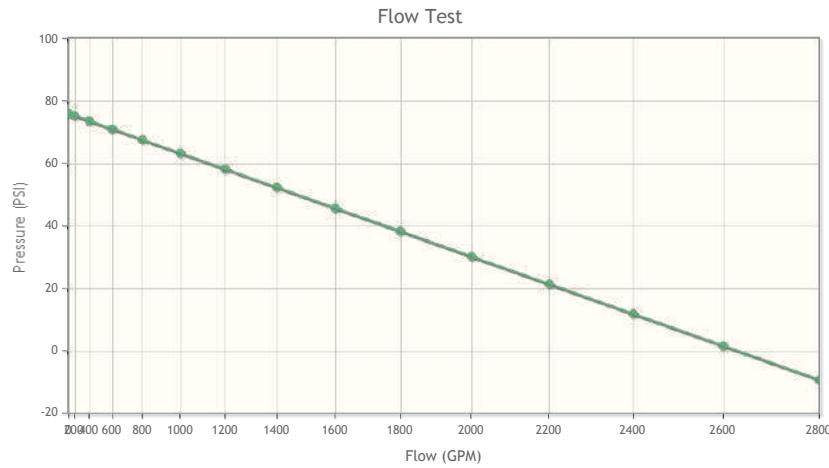

Summary: This app provides a  $N^{1.85}$  logarithmic graph based on NFPA 291 recommendations. We also offer a blank PDF logarithmic flow test sheet.

### Graph Points

76	Static Pressure
49	Residual Pressure
1504	Residual Flow

### Data Points

Flow	Pressure
1671.99	43.157

## **Reservoir - Pressure Conversion**

8-in Water Line in Cholla Road

Residual Pressure = \* 43 psi

$$H = \frac{P_d}{\gamma}$$

$P_d$ = Static Pressure (psi)

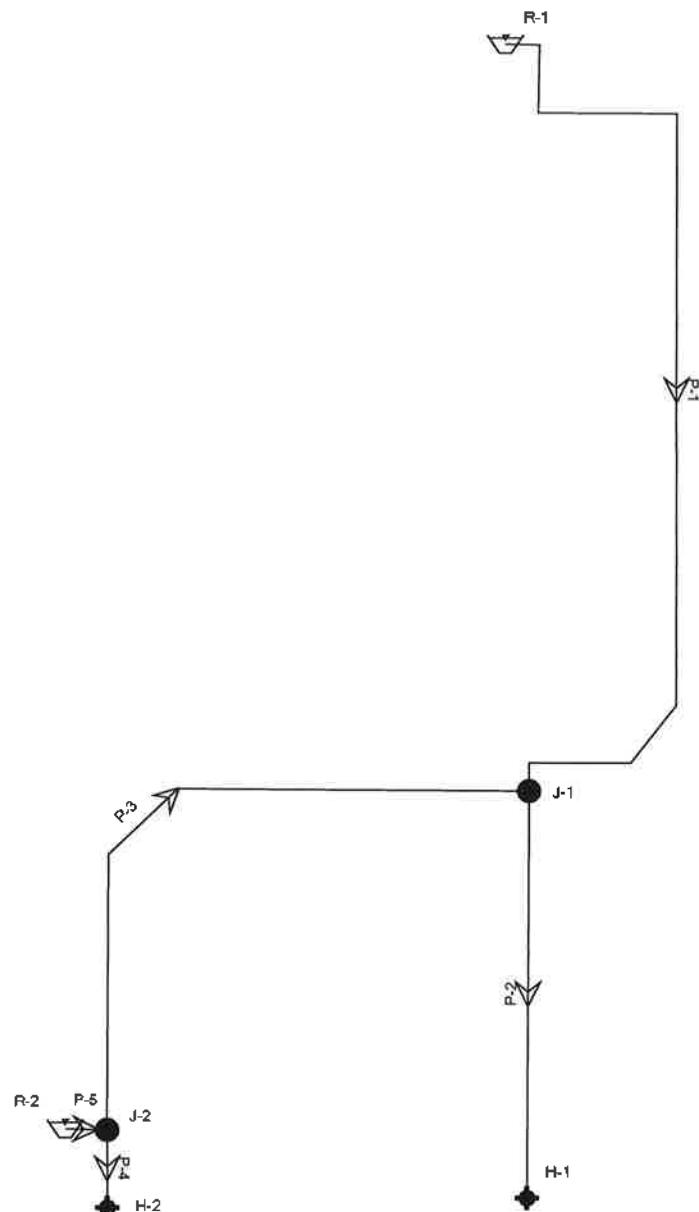

$\gamma$ = Specific Weight lb/ft<sup>3</sup>

$$H = \frac{(43)(144 \text{ in}^2/\text{ft}^2)}{62.4 \text{ lb}/\text{ft}^3}$$

$$H= 99 \text{ ft}$$

\* Residual pressure is based on flow test for a demand of 1,671.99 gpm.

## Scenario: Base

## **FlexTable: Reservoir Table**

Label	Elevation (ft)	Flow (Out net) (gpm)	Hydraulic Grade (ft)
R-1	183.80	483	183.80

H-2	83.80	672	180.33	42

# **APPENDIX B**

## **Sanitary Sewer Calculations**

## Sewer Demand Calculations

The sewer system was designed to handle the peak discharge from the site. The flow design method and criteria are in accordance with City of Scottsdale design standard. The average daily discharge as well as the peak demand were estimated by using the City of Scottsdale “2018 Design Standards & Policies Manual, Figure 7-1.2 Average Day Sewer Demand in Gallons Per Day & Peaking Factors by Land Use” as follow:

### Average daily flow

Number of Room:

88 (10 exiting and 78 new building)

Average day demand per dwelling unit:

380 gpd

Peak factor:

4.5

Average day demand =  $88 \times 380 = 33,440 \text{ gpd (23.22 gpm)}$

Peak day Demand =  $23.22 \text{ cfs} \times 4.5 = 104.50 \text{ gpm}$

The existing and new building will be service with a 6” sewer service. The sewer services will combine and discharge to the existing 8” sewer stub along the west property line. This sewer stub currently accepts the exiting flows from the existing south building. The sewer service design will be finalized by the plumbing engineer based on the 2012 I.P.C.

### Sewer Service Capacity

The capacities of the proposed 6-in services were estimated using Manning’s Equation assuming n=0.013 as follow:

$$V = 1.49/n \times R^{2/3} \times S^{1/2} \quad R = A/P ; Q = V \times A$$

A: Flow area of the pipe (sf)

P: Wetted perimeter (ft)

S: Downward (longitudinal) slope (ft/ft)

V: Average velocity in the pipe (ft/s)

n: Manning's Roughness Coefficient (0.013)

Q = Flow Rate, (cfs)

R = Hydraulic Radius, (ft)

According to the results of sewer model attached to the end of this appendix:

- The capacity of the proposed 6-in sewer service with slope of 1.0% = 0.56 cfs or 251.83 gpm > 104.50 gpm
- The capacity of the existing 8-in sewer service with slope of 6.96% = 3.19 cfs or 1,430.80 gpm > 104.50 gpm

Therefore, the proposed sewer services have enough capacity to service the hotel for the design peak flow.
