List of Appendices

List of Figures in Appendix E (Exhibits)

1.0 Introduction

1.1 Project Description

K. Hovnanian Great Western Homes is proposing to construct a single-family housing development on Parcel F of Silverstone at Pinnacle Peak, which is located at the southeast corner of Scottsdale Road and Silverstone Drive. The project is anticipated to consist of a single-family housing development and associated site infrastructure, including drive aisles, parking areas, and underground utilities.

1.2 Site Location

The proposed development encompasses approximately 22.1± net acres in a portion of the Northwest Quarter of Section 14, Township 4 North, Range 4 East of the Gila and Salt River Meridian in Maricopa County, Arizona. The parcel is bounded by Silverstone Drive to the south, 74th Street to the east, Rawhide Wash channel to the west, and Pinnacle Peak Road to the north. See Appendix A for the site location map and legal description. See Figure 1 in Appendix F for a Context Aerial Map.

The site is located at the former "Rawhide" western theme park area. Based on site observations, the structures associated with the theme park have been demolished, however, grading features including a raised race track, local drainage ditches, and unpaved roadways are present on the site.

1.3 Purpose

This Preliminary Drainage Report is intended to satisfy City of Scottsdale requirements and demonstrate conformance to the overall drainage characteristics of the area. This report provides a description of the current storm water drainage patterns and systems and a description of the required and proposed drainage improvements.

1.4 Objectives

This report provides a drainage plan for the subject site that is intended to meet the drainage standards and guidelines of the City of Scottsdale and the Flood Control District of Maricopa County (FCDMC). In particular, this report will demonstrate the following:

1. Buildings and site amenities will be elevated such that regional storm water flows from Rawhide Wash do not adversely impact the development.

2. Permanent drainage facilities will have a positive outfall, and any detained storm water will be disposed of within 36 hours.

3. Drainage facilities will be designed such that the 100-year post-development flows are collected and conveyed in such a manner so as to not cause damage to buildings and property.

4. Storm water detention is provided for the difference between the pre-development and post-development storm water volume.

5. Building finished floor elevations are in compliance with FEMA and City of Scottsdale requirements.

6. The proposed drainage plan for the site will be in general conformance to the Master Drainage Report for Silverstone, prepared by Wood, Patel & Associates, March 2007 and subsequent revisions by Wood, Patel & Associates and Kimley-Horn and Associates, Inc.

2.0 Description of Existing Drainage Conditions and Characteristics

2.1 Existing Drainage Conditions

The site currently consists of vacant land. The site is a portion of the previously demolished "Rawhide" western theme park. The general topography of the site slopes from the northeast to the southwest at approximately 2%. However, grading features including several small on-site drainage ditches, and unpaved access roads remain from the theme park use. Desert vegetation exists throughout the site.

Three on-site sub-basins drain to the south and exit the site at three locations along the southern property line. These sub-basins and corresponding 100-year discharges are shown on Figure 3 Existing Conditions Map in Appendix F.

2.2 Existing Off-Site Drainage Conditions

The Rawhide Wash regional drainage channel improvements were recently completed to the west of the project site. These improvements consist of a 300 foot wide, eight foot deep drainage channel that is designed to convey a peak flow of the Rawhide Wash from the Pinnacle Peak Road Bridge to the north of the site to the Scottsdale Road Bridge to the west of the site. This channel discharges storm water onto open desert on the west side of Scottsdale Road where it continues as overland flow to the southwest.

It is our understanding that a Letter of Map Revision (LOMR) has been submitted to FEMA in conjunction with the Rawhide Wash regional drainage improvements. This LOMR would remove significant areas surrounding Rawhide Wash from Flood Zone AO. At the time of this report, the LOMR is under review by FEMA and it is not anticipated that this review will be completed prior to the construction of the proposed development.

Based on the Letter of Map Revision Technical Data Notebook (TDN), prepared by Wood, Patel & Associates in May 2014, the Rawhide Wash outfall on the west side of Scottsdale Road is currently in an interim condition. This interim condition prevents the 100-year design flow of Rawhide Wash from passing under the Scottsdale Road Bridge and onto the open land on the west side of Scottsdale Road. As a result of this restriction, a portion of the design flow overtops Scottsdale Road and Silverstone Drive. Although this backwater and overtopping affects other parcels within Silverstone, adjacent to Parcel F the TDN shows the Rawhide Wash contained in the channel. Refer to Appendix E for the LOMR Technical Data Notebook.

The adjacent portions of Silverstone Drive and 74th Street consist of paved roadways with curb and gutters and storm drain infrastructure. Storm water from Silverstone Drive is collected in catch basins and conveyed to the Rawhide Wash channel. Storm water from 74th Street is conveyed via surface flow between the curbs before being collected in catch basins north of its intersection with Silverstone drive.

The adjacent portion of Pinnacle Peak Road to the north consists of a paved roadway with curb and gutter and a median. Runoff in Pinnacle Peak Road is collected in catch basins and conveyed via storm drain into the Rawhide Wash. Drainage channels paralleling both the north and south sides of the roadway, convey offsite runoff from the north into the Rawhide Wash, preventing it from reaching the site.

The land to the south of the site consists of the Appaloosa Library. Silverstone Drive separates the project site from the Library.

Based on the adjacent site conditions and the LOMR TDN, the only offsite runoff impacting the proposed development is the Rawhide Wash. Adjacent to this project, the Rawhide Wash is contained in the channel. Proposed structures shall be elevated above the Base Flood Elevations shown in the LOMR TDN. Refer to Figure 3 in Appendix F for the Existing Conditions Topographic Map.

2.3 Context Relative to Adjacent Projects and Improvements

The improvements to the Rawhide Wash channel, Scottsdale Road, and Silverstone Drive have recently been completed. See Figure 1 in Appendix F for the Context Aerial Plan.

2.4 FEMA Flood Hazard Areas

The site is located in Flood Zone "AO" according to the Flood Insurance Rate Map 04013C1310L, dated October 16, 2013. Zone "AO" is designated by FEMA as "areas of flood depths of 1 foot (usually sheet flow on sloping terrain) average depths determined for areas of alluvial fan flooding, velocities also determined." Refer to Appendix B for the FEMA FIRMette map for the site. An elevation certificate will be required for each building constructed in this flood hazard designation. Approval of the LOMR will remove the proposed development from the FEMA Special Flood Hazard Area.

3.0 Proposed Drainage Plan

3.1 General Description

In the analysis of the proposed drainage conditions the following items are considered:

- Area Types (pavement, building, and desert landscaping)
- Magnitude of areas
- Slopes
- Storm Drain
- Detention Basins

3.2 Proposed Site Conditions

Site-generated storm water will be collected in multiple catch basins and conveyed to one underground storage basin and four surface detention basins via underground storm drain pipes and street flow.

Of the detention basins, four are interconnected and upon reaching the last detention basin the outflow discharges via a weir into to the Rawhide Wash channel near the southwest corner of the site. The only detention basin that doesn't discharge into Rawhide Wash is Basin 3A and it discharges east into the stormdrain system in 74th Street. Basin 1A is the underground storage basin and consists of 10' CMP chambers providing an equivalent storage of 0.63 ac-feet. Refer to Exhibit 4 – Proposed Conditions Map for proposed sub-basins and detention basin locations.

The proposed site was modeled hydrologically in two fashions: 1) as a contributing sub-basin to the Rawhide Wash during a 24-hour rainfall event; 2) as an isolated site using the Rational Method. HEC-1 was used to perform the sub-basin and detention basin routing analysis. The Rawhide Wash models, both with and without the proposed site, are included in the Addendum 3 to the Master Drainage Report (MDR) for Silverstone. The routing analysis for the site, by itself, using Rational Method and synthetic unit hydrographs is included in Appendix C.

As stated in the Addendum 3 to the MDR, the proposed drainage concept does not increase flows in the Rawhide Wash during the 100-year event. Flow in the Rawhide Wash remains at 9865 cfs after development of the site. Since the adjacent Rawhide channel is designed for a 100-year event of 10,900 cfs (Patel 2006) and the Rawhide Wash Model results in a discharge less than that, it is demonstrated that the channel meets the criteria of providing sufficient capacity for the site and therefore the 2-year and 10-year events were not included in the Rawhide Wash Model.

The on-site sub-basins were modeled using the Rational Method to confirm that the detention basins could handle the sharper peaking and more localized storm. DDMSW was used to generate Rational Method results and output hydrographs that could be imported into HEC-1 for routing purposes. For the lone detention basin that does not drain to the Rawhide Wash, Basin 3A, an outflow of 1 cfs will leave the basin during the 100-Year event. The existing discharge at that same point is approximately 6 cfs. The "Site Only" HEC-1 model is located in Appendix C.

Only one proposed Sub-basin discharges unregulated from the site and that is Sub-Basin On-3 which discharges to 74th Street. Table 1 shows a comparison of discharge reduction at detention basins.

Table 1: 100-Yr Peak Discharge Reduction from Detention Basins

Detention Basin	24-Hr Storm		Rational Method	
	Inflow (cfs)	Outflow (cfs)	Inflow (cfs)	Outflow (cfs)
Basin 1A	5	1	13	1
Basin 1B	22	22	23	18
Basin 2A	40	34	38	6
Basin 2B	50	45	26	21
Basin 3A	*	*	12	1

* not included in Rawhide Wash Routing Analysis

Of the 45 cfs that leaves Detention Basin 2B during the 100-year, 24hr event, 41 cfs weirs into Rawhide Wash Channel and 4 cfs flows through a bleeder orifice into the park area. This was modeled in HEC-1 as a diversion.

3.3 Proposed Off-Site Conditions

No changes to the off-site conditions are proposed with these improvements. Storm water from adjacent portions of Silverstone Drive and 74th Street will continue to be collected in catch basins and conveyed to regional drainage facilities.

Administratively this site will remain in the FEMA floodplain and comply with AO zone requirements; however the Rawhide Wash Channel has been demonstrated to contain the 100-year flow event.

3.4 Future Conditions

The roadways to the north and east of the site are in their built-out conditions; therefore, these areas are not anticipated to have any future impacts to the project site. The area to the south is undeveloped, and any future developments in this area will be responsible for on-site management of storm water runoff.

It is also anticipated that at some point in the future the Rawhide Wash outfall will be completed to its final condition. At this point, off-site flows would no longer be anticipated to affect the site. The completion of this outfall would involve coordination between the City of Scottsdale, the City of Phoenix, the Arizona State Land Department,

3.5 Storm Water Storage Requirements

According to Addendum 2 to the Master Drainage Report for Silverstone, approved in April 2015, the required detention volume for the parcel is approximately 147,000 cubic feet. This volume contemplates detention for the 100-year, 2-hour rainfall event associated with the NOAA Atlas 14 rainfall depths. Due to a portion of the site's previous development (9 ac), storm water storage will be provided for the difference between the pre-development and post-development storm water runoff volume on that portion and full detention for the remaining 13 acres. An addendum to the Master Drainage Report that reflects this change will be submitted along with this Preliminary Drainage Report for the proposed development.

Table 2 below summarizes the contributing area, runoff coefficient for the contributing area, and the required and provided retention volumes.

Table 2: Storm Water Volume Required

Proposed Storage Volume Summary - Silverstone Parcel F						
Drainage Area	**Area [A]**		**Runoff Coefficient [C]**	**Precipitation Depth [P]**	**Required Storage (V_{REQ} = CPA/12)**	
	sf	**ac**		**in**	**cf**	**ac-ft**
Roadway	207,028	4.753	0.88	2.30	34,919	0.80
Pavement	21,399	0.491	0.95	2.30	3,896	0.09
Landscaping	232,504	5.338	0.45	2.30	20,053	0.46
Building	156,852	3.601	0.95	2.30	28,560	0.66
Duplex	343,201	7.879	0.81	2.30	53,282	1.22
TOTAL	**960,984**	**22.061**	**0.76**	-	**140,711**	**3.23**
Existing Storage Volume Summary - Silverstone Parcel F						
Drainage Area	**Area [A]**		**Runoff Coefficient [C]**	**Precipitation Depth [P]**	**Required Storage (V_{REQ} = CPA/12)**	
	sf	**ac**		**in**	**cf**	**ac-ft**
Roof	10,940	0.250	0.95	2.30	1,992	0.05
Disturbed Desert	379,843	8.720	0.55	2.30	40,042	0.92
Undist Desert (no credit)	569,765	13.090	0.00	2.30	0	0.00
TOTAL	**960,548**	**22.061**			**42,034**	**(0.96)**
					Total Required	**2.27**

Table 3: Stormwater Storage Functional Volume Provided

Detention Basin	Peak Volume
	AC-FT
Basin 1A/1C	0.61
Basin 1B	0.19
Basin 2A	0.93
Basin 2B	0.21
Basin 3A	0.35
Total	2.29

The storage volume summary reveals that 2.27 ac-ft of peak storage will be required to comply with pre versus post runoff volume storage requirements. Table 3, shows actual peak volume from the On-site HEC-1 model and provides slightly more than the required volume.

Refer to Figures 2 and 4 in Appendix E for the Preliminary Grading and Drainage Plan and the Developed Conditions Map, respectively. Refer to Appendix C for the Hydrologic/Hydraulic Calculations.

3.6 Pre- and Post-Development Runoff Characteristics at Concentration Points

The existing site consists of approximately 22.1 acres of vacant land that drains from the northeast to the southwest. The existing drainage patterns have three concentration points on the south perimeter of the site, reference Figure 3. In the pre-developed condition approximately 50 cfs combined exits the site on the south and enters the park.

The post-development flow at the south property line will be approximately 5 cfs combined. The bulk of the post development flow will discharge into the Rawhide Wash on the west where it presently does not; however, due to the difference in times of concentration of the Rawhide Wash and the site, the drainage from the site has no impact on the peak of the Rawhide Wash.

3.7 Proposed Drainage Structures or Special Drainage Facilities

Storm water quality will be maintained by elevating the outfall headwalls 3-6 inches above the basin bottom. This will allow the first flush of storm water to remain in the basin, where it will be disposed of via natural percolation. Orifice plates or pipe sizing will be used to meter the storm water outflow; sizing will be included with the Final Drainage Report.

Basin 1A (underground storage) will have a 4" orifice plate rather than the standard 6" orifice plate provided in the surface basins. This was verbally agreed to by City of Scottsdale.

 *** WARNING *** MODIFIED PULS ROUTING MAY BE NUMERICALLY UNSTABLE FOR OUTFLOWS BETWEEN       18. TO       46.
                 THE ROUTED HYDROGRAPH SHOULD BE EXAMINED FOR OSCILLATIONS OR OUTFLOWS GREATER THAN PEAK INFLOWS.
                 THIS CAN BE CORRECTED BY DECREASING THE TIME INTERVAL OR INCREASING STORAGE (USE A LONGER REACH.)

1.0 INTRODUCTION

1.1 General Background

This report has been prepared to address drainage requirements and provide a Master Drainage Plan for the development known as Silverstone. The Silverstone site (hereafter referred to as the Site) located in north Scottsdale, is approximately 160 acres and is bounded by Pinnacle Peak Road on the north, Miller Road on the east, Williams Drive on the south, and Scottsdale Road on the west. More specifically, the site is located in Section 14, Township 4 North, Range 4 East of the Gila and Salt River Meridian. Plate 1 – *Vicinity Map,* illustrates the Site's location.

The proposed Silverstone consist of mixed use land including municipal, retail, office, residential, open space, and public streets as applicable per City of Scottsdale Zoning Case 15-ZN-2005, 13-UP-2005.

As per the City of Scottsdale Stipulations, this master drainage plan endeavors to address the following:

1. *DRAINAGE MASTER PLAN: The developer shall submit a master drainage report and plan subject to city manager or designee approval. The master drainage report and plan shall conform the approved Drainage Design Report (Plan Check #3678-05) and to the Design Standards and Policies Manual – Drainage Report Preparation. In addition, the master drainage report and plan shall:*
   - *A. Include a complete description of requirements relating to project phasing.*
   - *B. Identify the timing of and parties responsible for construction of all storm water management facilities.*
   - *C. Identify improvements to the Rawhide Wash, including but not limited to retaining walls, scour walls, head walls, bridges, control structures, street and pedestrian crossing, and open space amenities.*
   - *D. Correspondence with State Lands/City of Phoenix to west*
   - *E. Bridge timing/responsibility (Scottsdale Rd. and Pinnacle Peak), with possible grade separated crossing for pedestrian access under Pinnacle Peak Road and under Scottsdale Road.*

F. *Before master drainage report approval, the developer shall, when requested by City Manager or Designee, submit two (2) hard copies and one (1) disc copy of the complete master drainage report.*

G. *Before the improvement plan submittal, the developer shall have obtained approval of the master drainage report.*

1.2 Drainage Background

The Site is situated on an alluvial plain within upland Sonoran Desert containing moderate slopes. The entire Site is located within the Rawhide Wash watershed and its Federal Emergency Management Agency (FEMA) designated 100 year floodplain (see Section 1.4 FEMA Floodplain). The Site consists of undeveloped desert terrain with vegetation and a mixture of buildings, dirt paths and drives from the now abandoned Rawhide development. Rawhide has disturbed the Site from historic conditions. The Site generally slopes toward the southwest at approximately 2.4 percent. Some exceptions are a raised dirt track located in the southwest corner of the site and a raised dirt dike bordering the site on the north and east sides. A major named wash, Rawhide Wash traverses the north western portion of the site.

In a rainfall/runoff event, Site is believed to receive offsite flows from the upstream Rawhide Wash watershed. The offsite flows from Rawhide Wash are believed to currently continue through the Site in Rawhide Wash and the small drainage corridors created by the previous owner. This offsite flow leaves the Site at a dip section in Scottsdale Road. The raised berms on the north and east boundaries of the Site are believed to protect the Site from any other offsite flow potential. Therefore, the Site is not impacted from offsite flows other than previously mentioned and only generates local onsite flows which generally start at the north portion of the Site and travel south-southwest through the Site.

1.3 Drainage Concept

This Drainage Master Plan presents a drainage investigation of the Site and addresses several areas: the Site, the proposed public roadways within the Site, and Rawhide Wash.

The Silverstone Development consists of proposed public roadways (Silverstone Drive and 74th Street) and private parcels. The north-south public roadway 74th Street, will

contain a proposed storm drain system to capture roadway flows and provide a bleed off option to parcel detention basins. This storm drain system will outlet into the proposed channel along Williams Drive while the storm drain system on Silverstone Drive will outlet into the proposed scenic corridor along Scottsdale Road (see Plate 3 – *Silverstone Drainage Map*).

The proposed parcels will retain the 100-year, 2-hour volume as required by the City of Scottsdale development guidelines. The detention basins will bleed off within 36 hours into the roadway storm drain system or existing drainage corridors per the design of the parcel developer and their engineer.

Rawhide Wash will be channelized from Pinnacle Peak Road to Scottsdale Road. The channel will be designed in two phases, an interim and ultimate condition.

1.4 FEMA Floodplain

The Site lies within a Federal Emergency Management Agency (FEMA) designated Zone AO, per Flood Insurance Rate Map (FIRM) Panel 1235 of 4350, number 04013C1235G, dated September 30, 2005 (See Plate 2 – Flood Insurance Rate Map). Zone AO is defined by FEMA and per the FIRM Panel as follows:

> *Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain), average depths determined. For areas of alluvial fan flooding, velocities also determined.*

The average depth displayed on the FEMA FIRM for the Project Area is one (1) foot with a velocity shown as four (4) feet per second.

Re: **Silverstone Parcel C**
Addendum No. 1 Master Drainage Report
Comment Response Letter
WP# 042309

Dear Mr. Anderson:

Following are our responses to Addendum No. 1 of the Master Drainage Report 1st Review Comments, dated January 7, 2014:

1. Comment #1: Provide a cover sheet similar to the original master plan cover sheet that clearly identifies this report as addendum #1 to the original report.
   Response #1: As requested, a cover sheet has been added to the report identifying it as Addendum No.1 to the Master Drainage Report for Silverstone.

2. Comment #2: Provide a full .pdf copy of the report on disc for City records by approval.
   Response #2: As requested, a CD containing a PDF of the MDR addendum has been included in the back of the revised report.

3. Comment #3: Please call me to discuss the including parcels D and hopefully E in the pre versus post C analysis as part of the master plan update. Ideally, the City would like to include the entire development in the update. A pre versus post C analysis for these parcels would result in a substantial reduction in storage. (If amenable to your client.)
   Response #3: Wood/Patel has been directed by our client only to pursue the Pre vs. Post C analysis for Parcel C of the Silverstone Development. It is our understanding that our client would prefer to pursue pre. Vs. post C analysis of the other undeveloped parcels at time of parcel development, and would submit additional addendums to the MDR at that time.

Please contact our office with questions regarding the above responses.

Sincerely,

WOOD, PATEL & ASSOCIATES, INC

ADDENDUM No.1

COS # 425-SA-2006 #15-ZN-2006, 124-NP-2006, PC# 3476-06-2

- Addendum No.1 to the Master Drainage Report
  Silverstone - March 2007, WP# 042309
- City of Scottsdale, Stormwater Management Division, Approved 3/18/07
- Justification #1: In January 2010, City of Scottsdale updated "Design Standards and Policies Manual, Chapter 4. Grading & Drainage, NOAA Atlas 14, Volume 1, Version 5, Point Precipitation Frequency Estimate. The updated rainfall volumes are lower in this area of north Scottsdale. (P=2.41 inches 100-year, 2-hour event)
- Justification #2: During recent correspondence with the City of Scottsdale Stormwater Management Division (COS), Wood, Patel & Associates, Inc. (Wood/Patel) was informed of a recent revision to the COS stormwater storage policy. The policy revision is valid for previously developed sites, such as Silverstone Parcel C (previously a portion of the Rawhide development). Per the revised policy, areas of the proposed development that were previously developed are required to provide a storage volume equal to the increase in runoff volume generated by the proposed development during the design storm event (100-year, 2-hour storm). Areas of the proposed development that were previously undeveloped are required to provide a storage volume equal to the entire runoff volume generated by the proposed development during the design storm event.
- Revisions to the Master Drainage Report (MDR) are as follows:
  - Table 4.1 – *Parcel Detention Requirements* is revised as shown below:

Table 4.1 – Parcel Detention Requirements

Parcel 1 Basin	Tributary Area	Weighted runoff coefficient	Required Volume	Required Volume
	ac		cf	ac-ft
A&B*	4.5	0.9	41274	0.95
C	12.35	**See Appendix B**	**47766**	**1.10**
D**	13.5	0.9	106291	2.44
E**	16.7	0.76	111033	2.54
F**	22.1	0.76	146936	3.37
G**	23.8	0.76	158239	3.63
H*	32.8	0.76	254867	5.85
Park*	1.9	0.33	6998	0.16

* These parcels are built out. Volumes are not updated.

ADDENDUM No.1

COS # 425-SA-2006 #15-ZN-2006, 124-NP-2006, PC# 3476-06-2

** Required detention volumes for these parcels are updated based upon updated rainfall depth data. Recent changes in C.O.S. stormwater storage policy for previously developed sites may allow for a reduction in required storage volume, but this reduction was not explored for these parcels in this addendum.

- Plate 3 – *Silverstone Drainage Map*, which displays possible locations of proposed detention basins, is revised. The revised plate is attached and dated December 3, 2013.

- Additions to MDR are as follows:
  - Appendix B is added to the MDR and includes the following:
    - Table B1 – *Parcel C Required Stormwater Detention Volume*
    - Table B2 – *Parcel C Pre-Existing Condition Weighted Runoff Coefficients*
    - Table B3 – *Parcel C Post-Developed Condition Weighted Runoff Coefficients*
    - Exhibit 1 – *Pre-Existing Condition Map*
    - Exhibit 2 – *Post-Developed Condition Map*

Table B2 – Parcel C Pre-Existing Condition Weighted Runoff Coefficients
Table B3 – Parcel C Post-Developed Condition Weighted Runoff Coefficients
Exhibit 1 – Pre-Existing Condition Map
Exhibit 2 – Post-Developed Condition Map

Table B1 - Parcel C Required Stormwater Detention Volume, $V_{REQ'D}$

Project: Addendum to Master Drainage Report for Silverstone
Location: Scottsdale, Arizona
Description: Calculation of required stormwater detention volume
References: Design Standards and Policies Manual, Chapter 4 - Grading & Drainage, City of Scottsdale, January 2010
NOAA Atlas 14, Volume 1, Version 5, Point Precipitation Frequency Estimates

Known Values: Design storm: 100-year, 2-hour
Rainfall, P: 2.41 inches

Calc. Values[1]: $V_{REQ'D} = \frac{P}{12} \; x \; A \; x \; C$

Where: $V_{REQ'D}$ = Required stormwater detention volume
P = Rainfall depth for design storm event
A = Area of watershed contributing
C = Runoff coefficient (see below for calculation)

For Pre-Existing Developed Areas[2]: $C = C_{POST} - C_{PRE}$ **For Pre-Existing Undeveloped Areas[3]:** $C = C_{POST}$

Where: C_{PRE} = Weighted runoff coefficient for pre-existing condition
C_{POST} = Weighted runoff coefficient for post-developed condition

Notes:
1. Based upon current C.O.S. stormwater storage requirements, areas of the proposed development that were previously developed are required to provide a storage volume equal to the increase in runoff volume generated by the proposed development during the design storm event (100-year, 2-hr storm). Areas of the proposed development that were previously undeveloped are required to provide storage volume equal to the entire runoff volume generated by the proposed development during the design storm event.
2. For previously developed areas, the required storage volume is calculated using a runoff coefficient equal to the inrease in the runoff coefficient from the pre-existing to the post-developed condition ($C=C_{POST}-C_{PRE}$)
3. For previously undeveloped areas, the required storage volume is calculated using a runoff coefficient equal to the post-developed runoff coefficient ($C=C_{POST}$)

ADDENDUM No.3

COS #425-SA-2006, 315-ZN-2006, PC#3476-06-2

- Addendum No.3 to the Master Drainage Report Silverstone- March 2007
- City of Scottsdale, Stormwater Management Division, Approved 3/18/07 (Original), Addendum No. 1 approved 3/6/14, Addendum No. 2 approved April 2015.

- Justification #1: In 2013/2014 a large drainage channel was constructed to convey the Rawhide Wash from the recently constructed box culverts under Pinnacle Peak Road to the recently constructed box culverts under Scottsdale Road. This drainage channel comprises the eastern edge of Parcel F of Silverstone. The design discharge for the Rawhide Wash channel was estimated by URS utilizing USGS Regional Regression Equation #13. The design discharge was 10,900 cfs. The Flood Control District of Maricopa County previously completed a Drainage Study for Rawhide Wash upstream of Happy Valley Road. The Hydrology for this study was completed utilizing HEC-1, following Maricopa County standards. Kimley-Horn extended the HEC-1 model to Scottsdale Road. The 100-year discharge at Scottsdale Road per the extended HEC-1 model is 9,865 cfs. Although the HEC-1 discharge is less than the Regional Regression discharge, it is within the standard error of the Regression Equation. The extended HEC-1 model for Rawhide Wash was then updated to include the proposed runoff from Parcel F. The results show that the onsite discharge does not impact the discharge within the Rawhide Wash.

- Justification #2: The series of retention basins for Parcel F will provide detention for the design storm (100-year 2-hr) runoff volume. Per discussion with the City of Scottsdale areas of the proposed development that were previously developed are only required to provide a storage volume equal to the increase in the runoff volume generated by the proposed development during the design storm event (100-year 2-hr). Silverstone is part of the previously developed Rawhide development of which approximately 9 acres included rooftop and disturbed desert. These 9-acres were credited as existing development and the volume provided is only the increase in development runoff while the remaining 13 acres were calculated to provide the 100% design storm retention requirements.

Revisions to the Master Drainage Report (MDR) are as follows:

- Table 4.1 – Parcel Detention Requirements (Revisions shown in **BOLD**)

Flood Control District of Maricopa County
Upper Rawhide Wash Floodplain Delineation Study
FCD98-12

DEVELOPED CONDITIONS HYDROLOGY W/ CONTRIBUTION FROM SILVERSTONE PARCEL F

100 yr, 24 hr storm event
Prepared by Kimley-Horn and Associates, Inc.
KHA Job No. 191948001

UPDATED DECEMBER 1, 2015

This hydrology represents conditions of the Upper Rawhide Wash and its tributaries in existing conditions.

There are two existing flow splits at CP062 and CP066, they will be cut off and routed 100% to the dam site as part of the dam project. This model accounts for the proposed diversion works with Rawhide Wash Dam.

Input parameters for the model were determined using the Flood Control District of Maricopa County's (FCDMC) Drainage Design Menu System (DDMS).

The values entered into DDMS were based on the following:

Rainfall depths	Point precipitation values were determined using the isopluvial maps in the FCDMC Hydrology Manual
Rainfall excess	The Green and Ampt Methodology was used for estimation of rainfall losses. Digital soil maps for the City of Scottsdale were used to determine soil distributions. Existing land use conditions were determined from the City of Scottsdale General Plan digital zoning map and aerial photos.
Unit hydrographs	The Clark Unit Hydrograph methodology was applied. City of Scottsdale digital topographic mapping with 1' and 2' contour intervals was used.
Routing	Normal Depth Channel Routing was used with 8 point cross sections approximated from the BOSS River Modeling System.

*** WARNING *** MODIFIED PULS ROUTING MAY BE NUMERICALLY UNSTABLE FOR OUTFLOWS BETWEEN     6207. TO   124529.
```

```
THE ROUTED HYDROGRAPH SHOULD BE EXAMINED FOR OSCILLATIONS OR OUTFLOWS GREATER THAN PEAK INFLOWS.
THIS CAN BE CORRECTED BY DECREASING THE TIME INTERVAL OR INCREASING STORAGE (USE A LONGER REACH.)

*** WARNING *** MODIFIED PULS ROUTING MAY BE NUMERICALLY UNSTABLE FOR OUTFLOWS BETWEEN 10363. TO 138889.
THE ROUTED HYDROGRAPH SHOULD BE EXAMINED FOR OSCILLATIONS OR OUTFLOWS GREATER THAN PEAK INFLOWS.
THIS CAN BE CORRECTED BY DECREASING THE TIME INTERVAL OR INCREASING STORAGE (USE A LONGER REACH.)

*** WARNING *** MODIFIED PULS ROUTING MAY BE NUMERICALLY UNSTABLE FOR OUTFLOWS BETWEEN 14955. TO 131376.
THE ROUTED HYDROGRAPH SHOULD BE EXAMINED FOR OSCILLATIONS OR OUTFLOWS GREATER THAN PEAK INFLOWS.
THIS CAN BE CORRECTED BY DECREASING THE TIME INTERVAL OR INCREASING STORAGE (USE A LONGER REACH.)

*** WARNING *** MODIFIED PULS ROUTING MAY BE NUMERICALLY UNSTABLE FOR OUTFLOWS BETWEEN 2875. TO 5311.
THE ROUTED HYDROGRAPH SHOULD BE EXAMINED FOR OSCILLATIONS OR OUTFLOWS GREATER THAN PEAK INFLOWS.
THIS CAN BE CORRECTED BY DECREASING THE TIME INTERVAL OR INCREASING STORAGE (USE A LONGER REACH.)

*** WARNING *** MODIFIED PULS ROUTING MAY BE NUMERICALLY UNSTABLE FOR OUTFLOWS BETWEEN 18. TO 46.
THE ROUTED HYDROGRAPH SHOULD BE EXAMINED FOR OSCILLATIONS OR OUTFLOWS GREATER THAN PEAK INFLOWS.
THIS CAN BE CORRECTED BY DECREASING THE TIME INTERVAL OR INCREASING STORAGE (USE A LONGER REACH.)

NOTES

1. ALL STREETS WILL BE PRIVATE. ALL STREETS AND ANY STREET LIGHTS TO BE LOCATED WITHIN THIS PRIVATE TRACT ARE TO BE MAINTAINED BY THE PROPERTY OWNERS ASSOCIATION.
2. FOR DISCHARGES AND RETENTION VOLUME CALCULATIONS, REFER TO "PRELIMINARY DRAINAGE REPORT FOR SILVERSTONE PARCEL F" PREPARED BY KIMLEY-HORN AND ASSOCIATES, INC.
3. ALL AREA SET ASIDE FOR DETENTION WILL BE WITHIN A DEDICATED DRAINAGE EASEMENT. THESE DRAINAGE EASEMENTS WILL BE CONTIGUOUS TO THE SUBDIVISION'S CIRCULATION TRACTS. THE MAINTENANCE OF THESE DEDICATED DRAINAGE EASEMENTS WILL BE THE RESPONSIBILITY OF THE HOMEOWNER'S ASSOCIATION. THE CITY OF SCOTTSDALE RETAINS THE RIGHT TO ACCESS THE DETENTION BASINS FOR INSPECTION OR MAINTENANCE PURPOSES FROM SAID CIRCULATION TRACTS.
4. ALL SITE CONSTRUCTION WILL OCCUR IN ONE PHASE.
5. ALL ROOF HEIGHTS SHALL CONFORM TO "HEIGHT ANALYSIS" (ATTACHMENT B) FOR STRUCTURE HEIGHT MEASUREMENT (15-ZN-2005) AND ROOF HEIGHT DETAIL ON THIS SHEET.

Request for Stormwater Storage Waiver

Request for Stormwater Storage Waiver

City of Scottsdale Case Numbers:

___ - PA - ____ ____ - ZN - ____ ____ - UP - ____ ____ - DR - ___ ____ - PP - ____ PC#_____

The applicant/developer must complete and submit this form to the city for processing and obtain approval of waiver request ***before submitting improvement plans***. Denial of the waiver may require the developer to submit a revised site plan to the Development Review Board.

Date _____ **Project Name** _____

Project Location _____

Applicant Contact_____ **Company Name**_____

Phone _____ Fax _____ E-mail_____

Address _____

Waiver Criteria

A project must meet at least one of three criteria listed below for the city to consider waiving some or all required stormwater storage. **However, regardless of the criteria, a waiver will only be granted if the applicant can demonstrate that the effect of a waiver will not increase the potential for flooding on any property.** Check the applicable box and provide a signed engineering report and supporting engineering analysis that demonstrate the project meets the criteria and that the effect of a waiver will not increase the potential for flooding on any property.

If the runoff for the project has been included in a storage facility at another location, the applicant must demonstrate that the stormwater storage facility was specifically designed to accommodate runoff from the subject property and that the runoff will be conveyed to this location through an adequately designed conveyance facility.

☐ 1. The development is adjacent to a conveyance facility that an engineering analysis shows is designed and constructed to handle the additional runoff from the site as a result of development.

☐ 2. The development is on a parcel less than one-half acre in size.

☐ 3. Stormwater storage requirements conflict with requirements of the Environmentally Sensitive Lands Ordinance (ESLO).

For a full storage waiver, a conflict with ESLO is limited to:

- Property located in the hillside landform as defined in the city Zoning Ordinance
- Property in the upper desert landform that has a land slope steeper than 5% as defined in the city Zoning Ordinance
- Property within the ESL zoning overlay district where the only viable location for a stormwater storage basin requires blasting

This full waiver only applies to those portions of property meeting one of these three requirements.

Partial waivers are available for projects or portions of properties within the Environmentally Sensitive Lands Zoning Overlay District, not meeting any of the three full waiver criteria above, if post-development peak discharge rates do not exceed pre-development conditions, based on the 10- and 100-year storm events.

By signing below, I certify that the stated project meets the waiver criteria selected above as demonstrated by the attached documentation.

Request for Stormwater Storage Waiver

City of Scottsdale Case Numbers:

___ - PA - ___ ___ - ZN - ___ ___ - UP - ___ ___ - DR - ___ ___ - PP - ___ PC#_____

CITY STAFF TO COMPLETE THIS PAGE

Project Name _____

Check Appropriate Boxes:

☐ Meets waiver criteria (specify): ☐ 1 ☐ 2 ☐ 3

☐ Recommend approve waiver.

☐ Recommend deny waiver:
- ☐ None of waiver criteria met.
- ☐ Downstream conditions prohibit waiver of any storage.
- ☐ Other:

Explain: _____

_____

☐ Return waiver request:
- ☐ Insufficient data provided.
- ☐ Other: _____

Explain: _____

_____

Recommended Conditions of Waiver:
- ☐ All storage requirements waived.
- ☐ Post-development peak discharge rates do not exceed pre-development conditions.
- ☐ Other:

Explain: _____

_____

☐ **Waiver approved per above conditions.**

☐ **Waiver denied.**

_____ _____

Floodplain Administrator or Designee Date

Request for Stormwater Storage Waiver

City of Scottsdale Case Numbers:

___ - PA - ____ ____ - ZN - ____ ____ - UP - ____ ____ - DR - ___ ____ - PP - ____ PC#_____

In-Lieu Fee and In-Kind Contributions

In-lieu fees are only applicable to projects where post-development peak discharge rates exceed pre-development levels, based on the 10- and 100-year storm events. If the city grants a waiver, the developer is required to calculate and contribute an in-lieu fee based on what it would cost the city to provide a storage basin, sized as described below, including costs such as land acquisition, construction, landscaping, design, construction management, and maintenance over a 75-year design life. The fee for this cost is $1.87 per cubic foot of stormwater storage for a virtual storage basin designed to mitigate the increase in runoff associated with the 100-year/2-hour storm event. The applicant may submit site-specific in-lieu fee calculations subject to the Floodplain Administrator's approval.

The Floodplain Administrator considers in-kind contributions on a case-by-case basis. An in-kind contribution can serve as part of or instead of the calculated in-lieu fee. In-kind contributions must be stormwater related and must constitute a public benefit. In-lieu fees and in-kind contributions are subject to the approval of the Floodplain Administrator or designee.

Project Name _____

The waived stormwater storage volume is calculated using a simplified approach as follows:

$V = \Delta CRA$; where
V = stormwater storage volume required, in cubic feet,
ΔC = increase in weighted average runoff coefficient over disturbed area ($C_{post} - C_{pre}$),
R = 100-year/2-hour precipitation depth, in feet (DSPM, Appendix 4-1D, page 11), and
A = area of disturbed ground, in square feet

Furthermore,

$V_w = V - V_p$; where
V_w = volume waived,
V = volume required, and
V_p = volume provided

R = _____
ΔC= _____
A = _____
V = _____
V_p= _____
V_w= _____

☐ An in-lieu fee will be paid, based on the following calculations and supporting documentation:
In-lieu fee ($) = V_w (cu. ft.) x $1.87 per cubic foot = _____

☐ An in-kind contribution will be made, as follows:

_____
_____
_____

☐ No in-lieu fee is required. Reason:

_____
_____

Approved by:
